Rory,

I don't think the card is current anywhere. I got mine from searching
round computer and ham radio fairs. I tend to pick these up whenever
I see them as spares, but I only have a few free.

I guess you probably need to search for some one with obsolete stock.
A google search did not turn up any sources of cards, but the actual
chips seem to be available cheaply. I wonder if it would be possible to
make a full standalone card?

Dave.

Dave,

AFAIK, the card was popular in the states back in 98 or so before the
cards went PnP and PCI. IF the chips were cheap enough, I think a
re-design of the ethernec is slightly out of scope of my abilities and
when you can find the cards they should be inexpensive. I do have 5 or
so ISA cards in the basement, but I will check which chipset they have
and at least try them out.

The charm of Ethernec card is that it re-uses obsolete cards. It doesnt
require the re-invention of the wheel. If we keep it simple, then we
keep it inexpensive. I'm not sure if the Atari takes full advantage of
10mb/s, so re-tooling wont give us any speed benefits that I know of.

The hardest part to make is the cartridge port connector. I've tried
several times (and spent around $200) and failed miserably just trying
to make the cart edge. I can (but not a lot) hand wire the single sided
board.

I just want to make sure that those who want a ethernec, can get one.
It is just a matter of getting enough money to place that first
important order of pcb's

Rory

4818. Sound Designer Copier?

My ancient Atari ST Sound Designer disk is starting to go a little wonky on me. Sometimes it works, sometimes it doesn't, usually it works though. I want to make a copy of the disk before it fails on me completely after all the thing is over 15 years old, it's not going to last forever.

Can anyone point me towards a copy program that'll let me copy this blasted thing the copy protection seems to be much more robust than anything I've got that copies disks which is most annoying.

Heck, if there's a cracked version of Sound Designer floating around out there that would do too.

Maybe this is just my Atari ST's way of saying "Put me aside, go use your PC".

Crackers

4819. Atari Internet BBS

Newsgroup: comp.sys.atari.st
Date: 2004-09-19 05:14:20 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2004.09.19.05.14.17.519005@nossspamXXatari-source.com>
Source record: 17114

Hello folks,

I'd just like to note that over at http://portal.atari-source.com, there's news of a new Octopus BBS release. For those that don't know, this is the single only Atari BBS package that runs natively on an Atari and uses the Stik internet connection to run an internet available telnet BBS (if you choose) or still functions in it's original form using any port, even MIDI.

I've taken up development and maintenance for Octopus BBS from the original author, Koos Kuil and it's completely free now. I've evaluated other Atari BBS options and I believe that no other package for the Atari is even remotely as flexible as Octopus BBS is. Take into account also that the current author is still around and will add any features you wish and if you have the idea to put up an Atari BBS, this is the way to go!

If you have any questions, just email me, or you can Download the BBS and read about it here:

http://portal.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewarticle&artid=22&page=1

You may wonder why I would bother maintaining an old BBS package. I think a lot of people are moving back to their roots a bit, hence the sudden influx of new people (or rather a return of old people) back to Atari well after leaving to PC's. I think having internet available BBS's suits that, if it is integrated into normal internet life (usenet, ftp, etc), so much the better. If for nothing else, it's something for my TT to do ;-).

If you're curious, the Octopus BBS is running on pikachu.dynup.net. Under windows or linux, just go to a terminal and type "telnet pikachu.dynup.net" and you got it :)

As always, please keep in mind that this is a work in progress. Most things probably won't properly like File transfers, magazines, allfiles listing, qwk and of course, the message bases have no activity.

Thanks,
Mark

There are two Mega's. A Mega ST4 and a Mega STE4, the STE is way better.
16Mhz cpu with cache, essentially a STE. The Mega ST4 is basically a STF
with a blitter chip.

Mark

Why not make your own, photo etching is cheap and cheerful, once you've got the template, which can be spewed out by any Laser or bubble printer you only need some photo reactive aerosol and some FeCl3 to stain your fingers with.

There is no difference between the two! Atari decided later on that the
Mega 4 sounded more professional without the ST in the name. They did not
want people thinking the Mega 2/4 was a Atari ST apparently! LOL

Tim

4828. AD: 20% off coupon first order at 8bitclassics.com!

Newsgroup: comp.sys.atari.st
Date: 2004-09-20 00:05:43 UTC
From: 8-Bit Classics <nospam@8bitclassics.com>
Message-ID: <a67sk0lgt0u3qbhma8kp64o535qc937tkr@4ax.com>
Source record: 17124
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.cbm,comp.sys.ti

Instead of having a special sale, I will let you pick what you want and save! Take 20% off of your order from 8-Bit Classics! Use coupon NEW20 when checking out.

What is new at 8-Bit Classics? Well, I have posted more items for different systems, and still have plenty to add. It has taken me a little longer than I thought, but getting there. I also have some items that I am working on that are unique.

I am still also looking for Links! I have gotten a few, and added a few myself of sites I felt or worthy that I frequent. Check them out and help other site owners.

Still looking for reviews of products! If you own a product and have a few minutes, please take some time to write a review and share your opinion with others on that particular item (good or bad). You still need to register to write a review, but registered users will get addiitonal emails (if they choose) about upcoming products before they are announced, additional discount coupons, and more. I might even get a $ off coupon for the person who writes the most reviews.

Thanks to all who has visited and purchased from 8-Bit Classics! I am hoping to be around for years helping the classic community with their needs.

Thanks,

http://www.8bitclassics.com

Highwire can't find its modules directory if launched from within Okami
by clicking on a html link. If I put a symbolic link to the modules
folder in the Okami path everything is OK.

Could this be a config error by me or a bug/anomaly in
Highwire/Okami/Magic6?

No problem overhere using freeMiNT 1.16.0/N_AES 2.0.0.
>
>Could this be a config error by me or a bug/anomaly in
>Highwire/Okami/Magic6?

Bug in Magic maybe?
I'm using the cfg as found in the package. I just changed the CACHEMEN
and the path of CACHEDIR path.

> IANAL, but I don't believe that's entirely correct -- or if it is, it's
> too narrow of an interpretation.

I'm beginning to agree with you. Certainly you can't copy a
commercial program and give it away. The so-called "warez" are
clearly illegal. Copying someone's artwork or source code is also
generally out-of-bounds. I suspect that's because even if the person
didn't intend to sell their work, they could have, and you are
supposed to compensate them for their efforts.

But then why are "look and feel" issues held to a lower standard?
Since this discussion began, I've spent a lot of time looking at
copyright-related web sites, and I can't come up with a clear view of
how copyright law is currently being interpreted. Perhaps it's yet
another case of "only lawyers know." I'd like to keep from being so
skeptical, but in an environment where legality is measured by years
after the death of the author and where there is no requirement for
the document to actually list the author, I'm not confident I'll ever
figure out exactly how copyright law applies to me. I do think that

my statements in this forum are pretty likely to be valid, but my confidence has diminished somewhat these last few weeks.

This looks like a simplified Eiffel. While I've no doubt it will work
fine, the Eiffel is probably the better bet, allowing for keyboard and
fan control as well. Satantronic is selling them for 25 euros
(http://www.atari.sk/satantronic/).

I never had any "real" problems with that, though I must admit I never made
the PCB.
I just passed the digram across to a friend who made the PCB. Bigest problem
was soldering the IDC connector to the boared, but I got there in the end.

> clock speed above 8Mhz?

Yes it is still alive! But I made a pause since July where I made enough overtime in my company on that month to gain 3 weeks of rest in August!

I also recently fast completely switched my main PC from Windows to Linux (I in the past had a dual boot but always came back to Windows). It took me time to be able to re-run under linux the Windows based programming software for the logic which is on board of my expansion card for the Mega STE

Again, this board is only aiming at the MEGA STE but is basically signal compatible with the STE.

There is for the time being no quotation at all for this backyard project. I shall only come to you guys and ask for interest when I have it fully functionnal. That is IDE-DRAM-PS/2-ROM, blitter compatibility...maybe STE version...

For now, flash ROM is 100% ok, I have timing problems with large IDE file transfers and also compatibility problems with some 16MB Dram modules I have in my possession. I still did not start to work on a PS/2 mouse support.

I have planned to bring soon my stuff to the lab in my company where I have access to some equipment which shall help me debugging the card!

voila,
Fred

PS: which STE do you have ?

pre-1991 versions have standalone blitter and socketed 68000
(overcloking possible)

post-1991 versions have blitter in the MCU and soldered 680000
(overclocking would mean lots of cutting in the mainboard)

Ah, Mendelson Electronics. Been there, could never take enough money along
for all the interesting things they have.

Their price is the same as I have seen them selling for at hamswaps,
computer shows, and even old radio collector shows. I have seem them
dozens at a time, and am sure there are enough. There is, where I am, a
large ham and computer swap, in the spring, and if some are still needed,
there will be a dozen or so there.

For ease in navigating their site, part number is 222-5501.

Yes, I'm subscribed to that.

Okay, I'll ask the question there.

Thanks much!

4849. Sound Designer track 4

Newsgroup: comp.sys.atari.st
Date: 2004-09-22 01:02:20 UTC
From: Crackers <bcracknell@sympatico.ca>
Message-ID: <N044d.11216$bL1.708379@news20.bellglobal.com>
Source record: 17144

Well checking the disk out it seems that track 4 is bad. The only thing I don't know for sure is if it's bad on purpose. Does anyone know the type of copy protection Sound Designer uses? Does it use the bad track / random string protection and purposefully leave one track unformated or does it use something else? My version of Acopy (1.2L I think) won't make a working copy which kind of makes me think it's a bad track on purpose.

Without being able to make a working backup of the failing disk I'm a little loath to go in with a disk doctor and try to repair the damaged track. Better to just use a program that works 3/4 of the time than screw it up so it won't work at all.

You see this is one of the reasons I liked dongle protection, at least you can make freaking backups.

Tell that to Blizzard.

You can make games that are remarkably similar to other games on
the market. You just have to be careful to distinguish yourself enough such
that it's not painfully obvious that it's a clone.

I bring up the example of Blizzard because I used to code for Westwood.

Anyone have a good quote of something he said or something he did? What kind of Atari setup did he have? (You can tell an Atari user by his setup) ;)

All and all, I have been through a great loss like this before in another group where a friend, young blond nubile woman of like 26, died in a car accident just after getting her doctorate's degree. Man we still miss her. No loss is ever taken lightly. I have found that even hated people are missed in the end.

Would like to learn more about this person actually. If nothing else to revisit what he was all about.

Thanks!

This is really great, thanks! I have a TT that I am tempted to put on the network and use as a BBS. This a idea I've been knocking around for a bit now. Just need to get my daynaport working, and this program, and let er fly.

I understand this program is still quite buggy right?

How many out there have had luck getting the daynaport ethernet adaptor to work out there?

Thanks!

The email address for him I have is:

gryf@hrzpub.tu-darmstadt.de

And his postal address is/was:

Thomas Binder
Johann-Valentin-May-Stra﷿e 7
64665 Alsbach-H﷿hnlein
Germany

although I am not sure either of these are still current.

Regards, /Peter/

Aye some do accept paypal (Rodolphe did for me when i bought my
CT-60,I just added 4% for the charge paypal hit him with for using it)
It made my payment painless for me as they do the currency conversion
on the fly..all said and done it saved me like $50.00 in transfer fees
ect..plus its safer then simple wire transfer as you have 30 days to
dispute it (and i'm sure a transfer would be much harder) I want to
get a graffics card for my Mega STE but alas most sellers in Europe
are not willing to ship across the pond to the States (have asked
several times when I saw some up on ebay) I guess I been lucky as not
had a problem with scammers yet (knocks LOUDLY on wood) but then I
found most Atari user are very helpfull :)

Hi,
thank you for your response.

> Tell that to Blizzard.

Do you mean this ironically or truly? I would be happy if Blizzard
said "Yes, make your game but you must follow such and such conditions."
It would be a great assurance that it would be legal what I do.
But I could also get a response "No, Blizzard doesn't want you to do
anything what has just anything common with its products."
Anyway, I would know what their opinion is and I would know the risk.
But in the case of a negative response, there would be no more chance to
code such a game. (I would be under the sight of the Big Eye of
Blizzard. It's possible that now I already am.)

> You just have to be careful to distinguish yourself enough such
> that it's not painfully obvious that it's a clone.

Yes I know I must be careful. Therefore I also started this discussion thread. So you say that I must distinguish myself enough from the original work; and I agree.
If I was Blizzard itself, I could make an exact port to other platform. As I'm not Blizzard, I must create everything on my own; and, everything what can I "copy" is the "idea", the theme (war in Middle Earth, Lord od the Rings) and, maybe, a "spirit" of the game I loved to play on Atari (map-based and location-focusable strategy with elements of adventure). Do you agree?

Pavel

Thank you for your enquiries and time, Galen.

I agree that the "look and feel" issues are too vague in common and
one can never know if he's "copying" (against the _copy_right) or not.
We move here on a too thin ice, as we in Czechia use to say. Even if I
don't copy a piece of code, bitmap, tune or dialog from the original,
Blizzard can still impeach me that I copy their idea, their story, their
"look and feel". And this could happen even though I would design
everything a very distinct way (the game control, the story events,
scenes, dialogues...)
Now I speculate if it would be good to contact Blizzard and ask them
for an official opinion. It would be great to know what they and their
lawyers think about the game I want to write, even though their attitude
was negative. In the case of their positive attitude, I would know their
conditions to the game and its design.
Please write me what do you think about contacting Blizzard in this case.

Pavel

I suspect that's at least partly correct. It's pretty convoluted,
particularly in areas like "look and feel," as far as I can tell. Worse,
some "look and feel" issues may interact with software patents, which
currently exist mainly in the US, but that blight seems destined to come
to Europe, too, and I fear that when this happens, we'll see a spate of
lawsuits over software patent infringements.

In any event, as I recall, the first "look and feel" lawsuit was when
Apple sued DRI and/or Microsoft over copying the Apple interface, back in
the 1980s. IIRC, that one dragged on for years, and Apple's claims were
eventually whittled away to very little, but they did win on some points.

IMHO, contacting Blizzard is the wrong first step. If you're really
concerned about this, I'd suggest getting in touch with a lawyer who
you hire. Upon receiving a query about creating a game that's inspired
in any way by their own game, I suspect most game companies would either
ignore the query or give a very conservative response. ("No! You can't
use the same characters, game play, ideas, alphabet, language, screen
colors, or basic laws of physics we use! It's ours! Ours! Ours!") Of
course, hiring a lawyer will cost you money, but maybe not too much for
an initial consultation.

Not really, this was quite a mature program before I got my hands on it.
Now with each release it gets more stable. It doesn't really crash
anymore, you can tell just by telnetting to it. The only time it goes
down is for a version upgrade. And with the scripting and menus you can
customize the whole system to your hearts content. And of course if you
need any help understanding how to set it up for internet mode (which
isn't as well documented but easy nonetheless) you can ask me for help.
Buggy or not, this is the only supported BBS package left and I plan to
support multi-node telnet operation soon. What we really could use is
more or less gszrz for STiK. I have a zmodem program for unix but it's
for unix sockets and Octopus uses STiK so no real hope getting them to
cooperate without digging deep into gluestik, and even then that's only
good for MiNT users. I have more testing to do as far as running Octopus
under MagiC, etc but I can say for certain it runs well on Falcon and TT
with MiNT :-). I'm working hard to maintain compatibility with 4 meg
ST's, singleTOS and MagiC.

Thanks,
Mark

4874. Giving credit where its due...

One hears so much of "horror stories" when it comes to service that when something nice does happen, well...I like to give credit where credit is due. Just this week:

Brad Koda of Best Electronics continued his unshakeable support of Atari - I bought a Falcon memory board from him and having a few problems, he offers to send a SIMM guaranteed to work.

Steve Cohen of Wizztronics (the Falcon memory boards maker) offers to check the board and any SIMM I want to send with it, free of charge.

Thomas Binder, of the famed Thing desktop, after I e-mail him concerning re-registering, calmly informs me that he still has the details from where I registered several *years* ago, and sends the key, at no extra charge.

(and there are lots more - these 3 just stood out this week) :-)

This is the Atari community that I remember. Greatest bunch of people in the world. :-)

> case.

My personal opinion is that contacting another person's lawyer is
silly. There is a reason why lawyers are held in low esteem. Your
options are to:

1) Forget about the game

2) Code the game but never release it (keep it for personal
consumption)

3) Code the game and accept that there is a small (probably very
small) chance that Blizzard will actually sue you

4) Code a different game. If you are actually going to modify game
control, story events, etc., it shouldn't be particularly difficult to
modify the universe as well. Put the game in a slightly different
scenario, rename the protagonist, and you have your very own original
game! (Even if it was inspired by one you played long ago.)

Unfortunately, I think 100% safety is impossible. A famous vocalist
in the US was once sued for copyright infringement alleging his song
was similar to one the complaintant had written even though the
complaintant's song had stopped receiving airplay decades ago. When
you get an original idea, is it really original, or are you
remembering something you saw as a child? I say go for it, and put
out an Atari version too!

Hey sam, it is a regular floppy cable. If you are putting your machine
in a tower, just get a floppy extension lead. I just got one from an old
PC floppy based tape drive, works great;-)

> ;)

I can remember the countless threads or battles if you will between Magic and MINT. They are both great OS's. Each can serve a purpose or special functions that other may not have. But we wont rehash all that. If you followed any of those threads Dennis was definetly for the commercial based software and Magic and Jinnee fell into that catagory. He also did not think to highly of the HIGHWIRE project BUT I think towards the end he even thought that HIGHWIRE might become a good browser eventually. I would have to say hats off to the HIGHWIRE team it works really well on my CT60'ed Falcon. Where ever Dennis is now I am sure he is using his favorite Atari.

Dennis was definetly an atari user through and through, but he also loved his MAC's. I know for a fact he had 3 UMAX clones that were all accellerated. He also had a TT030 with a 256 meg RAM card and I believe it had the NOVA card but dont quote me on that. He also had countless other Atari computers some were setup others were in storage. I believe he had Mega STe's and a Falcon along with some 8-bit computers like the 130XE and a game system or two. He definetly loved Atari but just did not have the room to have ALL of them setup and functionally useable. If you would like to know more about him just let me know. I have countless e-mails from the last 4 to 5 years that started out maybe 1 page or less towards the end it was as many as 10 to 20 page e-mails. When you recieve a text e-mail that is some 30 to 50 K in size you know your getting a book full of information and there were times it would take 1 to 3 hours to read an e-mail from him and absorb all the information.

Thanks,
Carey Christenson

P.S. With all of Dennis's faults NO one can argue about his passion for the this platform. I for one am still in SHOCK!!! Atari has lost a great man. May he rest in peace where he is now.

My Daynaport works great. I would love it if there were a Mint
driver, but it works fine with the STing driver and TOS/GEM or MagiC.
I have found that most of the problems that I thought were related
to the Daynaport early on were actually other issues.

Is there a reason most do not use Paypal? Are there more costs on your end or
is it viewed as not being a secure form of payment. Ever time Ive asked
sellers from Germany if they take paypal or though tof using they have told
me NO.

I'm glad the project is still going, that's great:) Sometimes it seems everything that is happening is for hte falcon and hte more humle machines get a bit left behind.

My STe is a recased pre '91 model, socketed CPU, seperate blitter but has a Panther/ET4000 video upgrade fitted.

I've tried to get a Paypal account but failed in activating it - I have no credit card. My bank account data was not sufficient.

You should know that in Germany you can pay with your bank card (ec-card) if you don't have enough cash with you. So many people don't want to invest money for a credit card - it does not offer appropriate enhancements over the ec-card.

What I'm trying to find out is if the Falcon's orignial fdd cable is removable.
It seems to be on there pretty good, so I'm afraid to give it a good enough
pull to get it off. I've got several pc fdd cables.

Having bought a new house (joke) on the proceeds from refitting the floppy
cables I can advise you to give it a good pull then send it over to me to be
fixed. In other words, DON'T TRY IT. Use an extender same as I do in my rack
kit.

> It seems to be on there pretty good.

Sure is, leave it alone.

Hallo Atari!

AO>Is there a reason most do not use Paypal?

Until very recently, it hasn't been available in germany at all. And as Alexander pointed out already: Within europe (the European Community, that is, and therein especially those countries that have got the Euro), you can make bank transfers quite cheaply, and at least in germany you can pay with your bank card at almost all fuel stations and in hotels and many shops.
I've also got "homebanking", where I can send money from my bank account to any other within germany _at_ _no_ _cost_ at all, using a PC and a PIN/TAN combination. To foreign countries, the banks charge some money, but within the Euro zone, this should be quite inexpensive now thanks to some legal regulations.

Credit cards are more expensive, and PayPal is just about to start over here.

With best regards
Ekkehard

I desoldered the falcon floppy cable (since I gave it a good pull ;-)
oops). and soldered on a regular header and floppy cable and lo and behold
it works. So if you want, I can do this to yours, but if there's floppy
extenders, this is THE way to go. Actually I don't think I pulled on
mine. I think it just broke. I was however able to use it for a very
long time by pushing all the wires down on the pin header where they're
supposed to go. But this was flaky which encouraged me to get angry one
day and do it right ;-) Now my floppy works perfectly.

Thanks,
Mark

Not easily :)

> > It seems to be on there pretty good.
> Sure is, leave it alone.

Or you can follow the instructions in this article, to replace the
original cable with a longer one:

http://www.myatari.net/issues/dec2001/casemod.htm

I did this just a few days ago actually, and now have a long enough
floppy cable
to reach from the board to the floppy inside the tower case.

Which solution to go for is up to you. The extender thingy is easier
for sure, but replacing the old cable is a valid option too. I had no
problems getting this to work anyway.

Regards,

Joakim

I use Magic 6.1 and Mint. Under Magic I just change the path
setting in Okami to Highwire and then put Highwire into memory. I
just load HW in and then use Okami and they work fine together.

```

I really don't gave a clue what these files are.
Unpacking the archive doesn't help me much as the the text files seems
to be unreadable for me. They appeared to be in crunched with Pack Ice.

Can someone tell me what these archive are?

Advise to future uploaders: always upload a plain ascii file in which
you explain what the archive are.

ST Magazine Subscription News
Well only a week late but here are the details for the Subscription of 3 , 4
or 6 Issue of this translated from French magazine.
You can check out whats available here <http://stmagazine.org/>

3 Issues normally cost £10.50, now on subscription rate only £10.00
4 Issues normally cost £14.00, now on subscription rate only £12.50
6 Issues normally cost £21.00, now on subscription rate only £18.00
This rate includes postage and packing for the UK.
For USA, Australia and other English speaking Countries please add another
£1.00.
For French speaking countries please refer to http://stmagazine.org/
You can start you subscription from Issue 132, whilst it's in stock or just
email me with your preferred start Issue number.
I know you will enjoy this magazine and it is written by enthusiasts for
enthusiasts.
Subscription can be made through the 16/32 Webshop and just click to the
Atari Magazine Section and go to your preferred section.

My first thought about these filenames was that they are very similar to how filenames of disk images of cracked (old - illegal?) games are titled, or at least the ones I've seen floating around on emulator sites.

This is obviously the games Chu Chu Rocket and GodPey, from Reservoir Gods. Not illegal at all, but interesting that someone would pack them in these "DCD_xxx.zip" files and upload them, especially since I think they're already on your server.

They might be collections of games and demos from coding groups such as "Reservoir Gods" and maybe others. That would be my guess, anyway.

And about 50c from anywhere else

Best to find a duff PC from a jumble sale and get all the bits you need from
that.

I'm wondering what fonts others are using for Highwire? I get a
message something like "font for pre #"" is not monospace, ignored."
Are there some monospaced fonts somewhere that I can install to avoid
these messages?

Thanks! That seems to be working fine for now (system font). I
previously tried the "Monospace 821" but it caused a crash for some
reason.

Finally, I have chosen variant #4. Except I don't want to rename the protagonist because of the model book, Lord of the Rings. The story cannot be too different due to the same reason. But I think there is still a large space for the game's originality. So I'm not going to modify something; I will just code my own project, remembering a game I once used to play.

And be sure that I'll write it for Atari too. Long live Atari!

Pavel

The easiest to use is your screen font, though the Atari one is a bit ugly. I can think of four others: The most common is Monaco Mono (which I use as my default screen font). This is a bitmapped font, available in 8, 9, 10 and 20 pt, and doubled-up (somewhat blocky) as 16, 18 and 40pt; there is also an ISO 8859-1 variant with a different extended characterset in 10pt and doubled 20pt. I'm sure there are many more - I personally find Monaco the easiest to read.

Common Speedo vector fonts include various Couriers (10 Pitch and SWA) and Monospace 821. In TrueType there is Courier and Lucida Console. All of these are available in virtually all sizes. Again, there will be many more, such as OCR-A and -B ...

Regards, /Peter/

I can't for the life of me think of the names to two games that I used to play, nor can I find the disks.

The first one was played on a grid where you had to place "atoms" into squares and when they were full they exploded taking over the opponents "atoms"

And the second one was some kind of space thing, t'was a first person perspective where you had a floor that was made of tiles and you had to rotate the view to keep the tiles at the bottom of the screen, the aim was to go between planets and there were things like shops and stuff on the way.

Cheers for any ideas

Tim

Hey I'd have to check the rates, didn't think it was that easy/cheap in
every European country.
I know banks charge a lot cheques in euros from a country to another,
which is a shame...

Cheers
Simon

I don't know about the second game but the first sounds like atoms -
it was available on the disk 3 "Games" disk that was originally packed
in the ST, although there are probably several clones.

Ahhhhh, I've managed to find the first one :-) it was Chain Reaction :-)

Still no idea on the 2nd one though, I seem to remeber I had it on a coverdisk so it was probably on one of the ST Format ones.

Is there a catalogue of coverdisks anywhere? maybe I could find it on one of them.

Cheers for the help so far.

Hi Atari Fans!

I'm trying to write software for Mï¿½rklin Digital. Mï¿½rklin Digital is a standard to control model locomotives. If you want to use Mï¿½rklin Digital, you have to buy very expensive hardware from Mï¿½rklin. However, there are a few pc software emulations for this.
I'd like to write another for atari, but my problem is the serial port. To meet the specs (http://home.arcor.de/dr.koenig/digital/motorola.htm) I need to send digital pulses of 13 and 26 microseconds duration. One solution to implement this (check http://www.vogt-it.com/OpenSource/DDL/) is to set up the serial port to 76800 and 38400 baud. As the ST supports officially only 19200 baud, I wonder if it might be possible to clear the mfp usart divider (1/16) to get the baudrates. However, there are some people who report limited success (see url 1 below).
Another possible solution of which I know a pc implementation, is to set/clear the bits on the usart directly using a 13us timer loop. Can I use bit 2 and 1 of hardware register $FFFA2D for this (url 2)?
Or should I use the parallel port or even the midi port? It would be nice if you could help me.

Matthias

4923. CT60 fitting help

Newsgroup: comp.sys.atari.st
Date: 2004-09-27 18:52:34 UTC
From: sf0218@aol.com
Message-ID: <20040927145234.25615.00001148@mb-m17.aol.com>
Source record: 17018

Hi all,

I'm in a bit of a bind. I have to do some soldering work on my Falcon's mb so that the ct60 will boot. I don't trust myself to do it, and I really don't want to pack up the mb and shipped to Rodolphe in France.

So, I would like to know if there is anyone, who lives fairly close to Northern Va.,
in the USA, who can help me with some Falcon mb work.

According to Rodolphe, the boot problems I'm having are because of 74F04 chip.

Can anyone actually do this for me, or give me some really good tips on how to do this?

"Follow the fitting instructions !
You have to remove this chip and the wires...and reconnect the 33 ohms SMT (surface Mounting Tech)
esistors (furnished in the packet of the CT60 !) on R216, R221 & R222.
After that , you will boot fine !
And solder the 47 ohms resistor on the SDMA CLK as explained on the fitting manual."

Thanks,

Sam F.

Interesting! The USA equivalent of bank transfers exists, but the
practice is still fairly uncommon as most of us do not bank online
(yet). In fact, my bank does not yet offer the option, and charges
$10 for what they call a "wire transfer". To foreign countries, the
charge is even higher.

On the other hand, the sender of money pays nothing over Paypal, and
my credit card company has a $1 fee for changing currency, so Paypal
and credit cards are at this time literally an order of magnitude
cheaper than wiring money from the USA to Europe.

Boy, I can testify to this - I just tried to send a bank to bank transfer to Germany (Woller Systems, N.aes) and my bank wanted to charge $55.00 to do this (on a $110 order!). Talk about highway robbery.

I finally sent it by Western Union. Way cheaper.

Sam,

I've done this work (removing 74F04 chip and reinstalling SMT resistors)
as well as the bus overclock and some other modifications on both my
falcon and one of Keith Scroggins's falcons (he lives in DC or near it).
You can either drive up to my house or ship it up. I live near
Philadelphia and I'll turn around and ship it back quickly. I'll make
sure that CT60 is running perfectly
:) I've got plenty of tests to make sure too and I know how to detect the
FPU bug that some of these 060's have. Email me privately for shipping
address, oh and btw I do this stuff for free (just return shipping cost
should be paid for by you). I'll also make sure your firmware is up to
date as I have a JTAG cable. So let me know what you like, the BUS

overclock is really nice and it helps improve disk access speed and display speed which is particularly slow on a falcon ;) I figure if I'm soldering on the board, might as well do both since the bus overclock is real simple. I recommend leaving it a standard overclock at 20MHz instead of 25MHz which I've had numerous problems with.

BTW: first part of my email is mducksub and last part is @atari-source.com (spam protection).

Thanks,
Mark

Make sure you are doing a global serch in Ebay..usually 1 or 2 for
sell across the pond but make sure you contact sellers to ask if they
are willing to ship to the states..sadly most aren't but worth a shot

Hello mark
I have a CT-60 which i will be Installing as soon as i get a few
remaining items..If i run into any problems like sam is having I may
have to ask for your assistance as well.. The drive would be a bit far
(Knoxville TN) but shipping wouldn't be a problem.. hopefully all will
go well but just covering all bases :)

Thomas,

LOL I just recently drove back from Biloxi, MS so Knoxville seems close to me ;-) But yeah it is a good 10+ hours. I wouldn't recommend making the drive unless you plan to stay in Pennsylvania for a week. I don't mind helping any US people out.

Thanks,
Mark

Hello Mark,
it would be good, if you could document in the way of photos with a brief explanation and labelling etc., each part of the fitting with solders process. This would help me (and i'm sure others) be more confident in doing it themselves! May be a web site or you could e-mail the info on request? Any way have a think.....

Cheers

4937. Power connectors (STe mobo)

Newsgroup: comp.sys.atari.st
Date: 2004-09-28 11:46:38 UTC
From: dark_willow1981@lycos.com
Message-ID: <168c84f1.0409280346.236c78e2@posting.google.com>
Source record: 17032

Finally got around to recasing my STe and all is well except for the power connections to the motherboard (pre 91 STe) and to the HD controller board (an Atari orginal RLL controller from a Megafile 30)

I can't seem to find any adaptors to change modern 5'25 ATX power connectros to the type used in the Atari. Is there anywhere I can an adaptor, or the plugs themselves?

I dont want to cut and resolder the ones from the orginal PSU's as I was hoping to sell the PSU's themselves when I no longer needed them

I desoldered my 50mhz osc and replaced with a 40mhz because my home made 72pin simm card wasnt as good as I had hoped, even though it was much better than my RAM GIZMO which wouldnt even work well at 20mhz.

Hmm someones making new 72pin simm cards I hear...

Coda.

Ken,

Firstly, you will have to email Rodolphe directly (rodolphe DOT czuba AT free DOT fr), as he cannot take pre-orders from the newsgroup. Secondly, just to make sure that you know what youre ordering (and for the benefit of others reading this thread)... The CTLink will fits on the Falcons expansion bus and is suitable for ALL Falcons whether CT60'd or not. The Ethernat on the otherhand, made by Nature (nature.atari.org - the supervidel team) fits on top of the CT60 ONLY, on the 060 direct access bus. It will be possible to run BOTH an Ethernat on top of your CT60, plus a CTLink underneath the CT60 giving 2 Ethernet and 4 USB ports (as if anyone needs that many! :-))

One thing you have highlighted to me Ken, is that there are probably other CT60 owners (and definately other falcon owners) out there that do not know about the CTLink/Ethernat projects... SO...

If anyone here is a member of an Atari forum/BBS where you have not seen the CTLink mentioned much/at all, can they post a message asking people (Falcon, MegaSTE & TT owners) to look at www.czuba-tech.com and www.janthomas.f2s.com to see of they want a CTLink, as the preordering window is closing soon! THANKS.

regards,
Coda.

CTLink VME : TT and Mega STE VME bus only
CTLink Falcon : Falcon bus only

EtherNat : CT060 bus only

EtherNat is faster than CTLink Falcon (CT060 bus is faster than Falcon bus)

The best choice for Falcon + CT060 is EtherNat (or EtherNat + CT Link for
more USB ;-))

@+

For the ATX, you can buy a PSU extension cable. I don't recall what the connectors on a STe look like but on Mega STe/TT you can use AT psu connectors. So you can hack up one of those old worthless AT psu's and then hack up an atx extension cable then you have a nice adapter.

Mark

4945. MSTE + TT : VME + CTLink

Well it's on Rodolphe's website. but don't do it unless you have a lot of
soldering experience and a good soldering iron. Temp, controlled etc.
The falcon is too valueable. By far the hardest part of the job is the
DSP trace. You don't want the iron there too long or you could lift the
trace easily.

I don't have any special knowledge, I just think I'm the only person on
this side of the atlantic who has done this. Perhaps not ;-)

4948. MegaST Keyboard adapter

Newsgroup: comp.sys.atari.st
Date: 2004-09-28 22:53:43 UTC
From: sf0218@aol.com
Message-ID: <20040928185343.07907.00001011@mb-m24.aol.com>
Source record: 17043

Hello All,

I purchased a MegaST keyboard for my falcon, now I need an adapter. Who was the person who made them? Or, is there a way to do it myself that does not involve any or next to nothing soldering?

Thanks,

Sam F.
Virginia U.S.A.
Atari Computer Nut
C-Lab Falcon, 14mbram,540mb hdd

Hehe, Keith Scroggins was selling a few I think.

his email address is kws and that's at radix.net

Thanks,
Mark

Awesome, what about a videl card for the TT;-)

Mark

4951. CTLink/EtherNAT USB?

Newsgroup: comp.sys.atari.st
Date: 2004-09-29 02:30:21 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2004.09.29.02.30.21.282424@nosspamatari-source.com>
Source record: 17046

Hello,

The EtherNAT/CTlink mentioned USB 2.0 support and speeds of around 1mbit to 11.something megabit. But hte 11mbit speed is USB 1.1, NOT USB 2.0 as is commonly misread. Real USB 2.0 is 480mbit, enough to use an external hard drive. So which do they have? And if it's only 1.1, please advertise as such?

Thanks,
Mark

I always thought the TT would make a great accelerated platform. I mean sure it has no DSP or wonderful falcon audio system but DMA is good enough when you have an 060's power. The videl seems like a really great platform to work off of, and since the TT seems faster to begin with, it seems like it would be a better platform to do such at hing. With the TTram board, maybe there's a better interface to the original hardware?

But a TT with a Supervidel, modified TOS 4.04 and a CT60 would really be a great machine. Sounds kind of like a Hades to me ;)

Well yes, but theres not going to be much in it. If you have a CT60
then it would be better to get an Ethernat if you only get one of the
cards, because less Falcon bus accesses will be done for some
operations, however for Network/USB saving data to hard disk for
example, the falcons 16bit bus still comes into play and there is your
bottleneck. What we need is a CT60 bus IDE controller...

> The best choice for Falcon + CT060 is EtherNat (or EtherNat + CT Link for
> more USB ;-))

Absolutely, unless your CT60 dies (God forbid), then will you have no
network/USB at all.

Coda.

Mark.

USB 2.0 is not about 480mbs. It INLCUDES a standard for 480mbs called
HIGH SPEED, but USB 2.0 compliant hosts/devices do not have to
transceive at that speed. The 2.0 standard is more about the USB
infrastructure as a whole, and many things have been added to the USB
spec. The fact is, the USB chips we are using in the CTLINK and
Ethernat are the Philips ISP1160 which ARE USB 2.0 compliant. see:

http://www.semiconductors.philips.com/cgi-bin/pldb/pip/isp1160.html

We do not use a high speed host device for 2 reasons:
1. Current atari platform is not capable of taking advantage of it.
2. The High Speed specification is overcomplicated for what it
achieves and it would take forever to bring High Speed USB to the
Atari.

Coda.

> trace easily.

DSP can be done much easier on most of the motherboards.. U can solder new DSP clock to the solder point where DSP track goes. Then u just cut a track from that solder point to 32mhz clock. Track is located on bottom side of the motherboard. But u must beware that some revisions dont have that track on bottom side, so "usual" DSP patch must be applied.

More info on this page (for CT60/CT2 doing what page suggest, aka fitting separate 50mhz clock for DSP, is advisable in case of DSP timouts)

http://atari.nvg.org/dsp/main.html (For CT60 u dont add oscillator, but just solde wire from CT60 to lower right solder point on top of motherboard and then cut the track as described. (on bottom side of motherboard!) CHECK BOTTOM SIDE FIRST!

Speaking of Keyboard adaptors. Does anyone know anywhere in Canada where I can buy one of those adaptors that lets you hook up a regular PC keyboard (and mouse) to a Mega ST?

The keyboard I have seems to be only semi functional at best.

If possible what about incorporating 16bit 48K or 24bit 96K audio??

4963. HDDRIVER, CF cards

Newsgroup: comp.sys.atari.st
Date: 2004-09-30 06:18:36 UTC
From: Uwe Seimet <Uwe.Seimet@seimet.de>
Message-ID: <2s1mq2F1freghU1@uni-berlin.de>
Source record: 16958

Hi,

has anyone successfully used IDE CF card adapters with HDDRIVER 8.1? I'm
asking because upcoming versions of HDDRIVER will most likely support
it, at least a particular kind of adapter hardware.
If it has already worked for some users this was by chance, not because
it was a supported feature. What I would like to know is

1. Have certain adapters actually worked for some users in the past, and
if yes, which ones one which machines?
2. Assuming that a future version of HDDRIVER supports such an adapter,
are there any users planning to update because of this new feature?
3. Is there any interest in a bundle consisting of an HDDRIVER update
and IDE adapter hardware known to work with HDDRIVER?

I'm currently testing all this with my Falcon, and it's nice to do
without any hard disk drive, but just use a noiseless CF card instead :-).

Please respond by email, and don't expect me to answer. I'm just trying
to find out if there is any interest at all in this potential new feature.

Uwe

It is easy to connect a VIDEL chip on the 16 bit VMe bus of the TT.
The bus of the TT is 16 MHz like Falcon...so il will work immediatly.

VIDEL could me boosted by a 50 MHz OSC instead of the 25 for better VGA
modes.
And a 50 MHz clock on the EXT pin could be done too to get the same
resolutions that with the Falcon with boosted bus (25 MHz).

But it will be placed at some new address.. and the driver (from the TOS4.04
init) must be done.
Not very hard...

BUT the price of the VIDEL chip is 45$ at BEST.

a better way should be to REPLACE the TTshifter by the Falcon VIDEL !
TT shifter is on a socket.. but you loose the TT high resolution...

No perfect solutions...

Mark,

I am interested in overclocking my Falcon030. I have to install a new RTC
chip and since I will have my falcon open I might entertain the idea of
doing this mod! Do you have some details on this?

Thanks!
Tim

Very interesting. I think it could be worth someone making the attempt.
not me though. I would definitely not do the soldering right on that ;-)

Tim,

You shouldn't do this unless you are good at soldering and have a nice expensive temp controlled soldering iron. Do you meet both those requirements? If so, then just look on Rodolphe's website ;-) http://www.czuba-tech.com. The bus overclock is simply just the CT60 installation with solders. And I don't mean to sound short, I just want to instill fear in people in the hopes that they won't solder for their first time ever, with a $15 radio shack iron on a Falcon ;)

Thanks,
Mark

Hmm I don't. I am actually a little worried about replacing the RTC chip.
I want to remove it and install a socket. I plan on cutting all the legs
off first then pop the chip off, then unsolder each leg of carefully. Then
when done install a socket. Any pointers?

Thanks
Tim

About a year ago, Frederic Pecourt was working with CF adapters. You might ask what he learned.

Mark Duckworth and Michael Schwingen also have mentioned them in the past. I think they might have gotten an IDE-CF running.

> 2. Assuming that a future version of HDDRIVER supports such an adapter,
> are there any users planning to update because of this new feature?
> 3. Is there any interest in a bundle consisting of an HDDRIVER update
> and IDE adapter hardware known to work with HDDRIVER?

I would seriously consider it, as I will have a semi-retired Falcon soon. I think you might sell more if you had an external solution. Many of us have our IDE bus taken up with the boot hard drive and a CD-ROM and I'm not sure CF is reliable enough to want to replace my hard drive on my main Falcon. It would be great to have known what CF card + IDE adapter + SCSI Adapter (probably from ACARD) combination works. Due to a lack of drivers, I suspect that it probably can be made to work, and with the CF-IDE board around $20US and IDE-SCSI box around $80US I'd suspect that the cost would work out to under $300US (+ HD Driver, of course).

Galen (who just sent this to Uwe's email)

Here's a tip. Buy an old 520 ST off ebay or something. it's very similar
soldering work to the RTC. Remove the main cpu for instance. You don't
want to snip the legs because then you'll have a more difficult time most
likely of cleaning the solder (and remaining pins) out of the socket.
It's easy to remove the solder with a solder pump (solder sucker) and you
need a HOT iron. My weller for instance, I set on 6 out of 10 possible

temps and it's a high wattage iron. Most people say low heat, but they're wrong ;-) Use high heat that way you can heat the leg up, get the solder out and get that iron off there before you ever even begin to heat up the chip. But not too high heat or else you'll fry the component on contact possibly.

By all means, PRACTICE on another machine except the falcon! As for the RTC chips, I wouldn't remove it. I would take a dremel and cut the top open, remove the coin cell battery and solder leads to AAA batteries that I can replace later on at my leisure. That type of thing to me isn't worth lifting a trace over or something else potentially disastrous.

If you can't with the greatest of confidence send a 520ST under the iron, then you should do yourself a favor and not work on the falcon. It's TOO rare. You're talking to someone who learned these lessons over 10 years ago :)

PS: Don't fool yourself into thinking you can get that new RTC or socket installed without completely cleaning all solder out of the holes. You can just heat up the row or things individually and slowly push the socket in. It doesn't work, I've tried it. The solder must be physcially removed from each hole using either a solder wick (if you're good enough) or perhaps easier, a solder sucker (little blue vacuum tool).

But I have to say, I'm not that great of a solderer. It's all in the iron, I cannot even BEGIN to believe the difference between the one I bought and the old crappy low wattage big tipped one I had. It's a HUGE difference. That's why I want you to practice, not so much because I distrust your skills, but more because I want you to see how tough it is to work with these boards with a remotely poor soldering iron. The solder just doesn't want to melt (this was my past experience).

The only reason I'll touch other people's falcon is because I know if I break it, I can give them my falcon ;-). I'm confident after doing two falcon's successfully as well. But I took a huge gamble doing my own falcon, and even with that $200 soldering iron I was NERVOUS.

Oh yeah, and what I've learned about removing components. Follow this step.

Have a wet sponge for tinning. Heat the iron up, and start cleaning it against the wet sponge. This will get old solder off. Then put a tiny bit of new solder on there. This is a properly tinned iron which will more easily melt the solder on the leg. Touch it to the leg and get it nice and melty. Position the solder sucker and press the trigger. Pull the iron away and inspect. With luck you pulled out all the solder. In a lot of cases you didn't. Only way now is to fill the hole back up with solder and try again. Solder loves to stick to itself, so use that to your advantage.. Once you get a little bit into the vacuum it should suck up all of it.

Once you get the component OUT, soldering a new component, socket or whatever into the board is pretty simple, assuming you didn't damage the

board by lifting a pad or whatnot. In that case it can make sense to have some solder flux around to try to repair the situ.

Thanks,
Mark

Up to now there was so little interest that offering anything would not make sense. It would have to be a cheap, internal solution anyway. I don't intend to become a hardware reseller :-).

If your Falcon is still in its original case there's no room for a
socket under the RTC; you will foul the keyboard.

I'd be inclined to follow Mark's hint about taking the top off the
original and soldering a new battery in place. You can get a coin cell
holder and a CR2302 or whatever it's called in Maplin.

Be careful when taking the top off, the crystal for the oscillator is
exposed.

I thought that the TT shifter was only responsible for the ST-Modes, TT-Low and TT-Middle. There is another IC in the TT that generates the TT-high. (Or maybe the TT-High DOES come from the shifter, but is sent to the monitor by this other chip).

Anyway, as these large ECL monitors gradually disappear from existance, the issue of having TT-High circuitry is going to be moot.

I have serious interest. I mean an old ST with an internal IDE
solution + 512MB CF card is quite adequate, and a 512MB CF card is only
$30 or so depending on where you shop. It's literally the cheapest way to
"HD" those systems. So I can't imagine there NOT being interest. A 20
gig drive is a waste for an older system like that. They probably can't
even use all the space.

It's definitely got to be another chip or something because of the
different signals... TTL versus something else right? TTM195 is a special
monitor.

Yes, pointers. Best to cut the pins away from the chip with a cutoff wheel
in a Dremel tool, or its predecessor, a DO-ALL, at least in the USA. I do
not know of manual cutters that will cut pins without risk of lifting a
trace.

Geez, there are a lot... :-)

Dungeon Master (and the sequel Chaos Strikes Back)
Ultima 3-4-5-6
Amberstar
Ishar 1-2-3

(not rpgs)
Gods
Chaos Engine
Turrican 2
Stardust (STe and up)

Very short list here, do this:
Google "atari ST games" and I'll bet you find lists for hundreds! :-)

> to put a HD into...

I have two ICD ADSCSI ST (internal boards) that I can sell.
Both tested to be working, but you will have to install it specially int
he Mega. Most likely you'll have to run 19 pin ACSI cable from outside
the computer to another port you cut on the outside for the ADscsi card.

But this has benefit of being internal. If you want an external solution
I have a nice external supra 40 meg hd with build in host adapter and DMA
cable, but it seems to only like the 40 meg drives. I tried to upgrade
them to sell as a 1gig+ unit to get some more money for it, but no good.

I have a lot of atari stuff that I have been cleaning, extensively
testing, photographing and cataloging for opening of my atari store,
though this store is mainly to sell off my spare items that won't sell
well on ebay because they're incidental items that people need because
theirs break like a floppy PSU ;) Also have quite a few rare items that
just don't belong on ebay.

Thanks,
Mark

Rodolphe,

I tried to order anyway. In case I do get accepted, does this look like an STram card that may work well with CT60 and boosted bus? If it's a matter of finding the right 72 pin SIMM, then I'm not worried, I have a box of them ;-)

Thanks,
Mark

I could try redoing this on my MB to see if 25MHz works properly again but
I doubt it's to blame. I played mp3 for 3 days as a way to test the DSP,
it works fine. The problem is most likely SDMA and/or videl. I.E.
without NVDI the tos desktop is corrupted and the Atari logo beside the
CT60 text on bootup also shows corruption at 25MHz (but not 20MHz). I
have an original Atari 4mb ST-ram card and I think that's to blame for all
my probs. I also need to get a better cooler if I want to overclock back
to 92MHz again. And I have these problems running ABE5L, downclock to
40MHz bus and all is well.

We'll see.. Maybe I can get one of these new ST-ram cards ;-)

The position of the SIMM is not the better to get the shortest data lines on
PCB, but it may be a good card ...
In fact it must be tried...and the SIMM quality is the most important factor
to avoid some bad pixels on the screen.
Some other boards with the simm position give some good results...

If you need a 14MB card...this is the only one...

Regards

This is not the ONLY one there is a guy in Poland if I remember correctly
that also has 14MB card for the Falcon. Ive emailed him but I can not
remember the price. He answered my email with in a few days. Ill email him
again for a price.

He also has a Cartridge IDE interface for the Atari for like $46 US
Dollars(converted from 160zl)

All can be seen at: http://www.rsi.pl/paskud/

The boards look alike except on the ram is on the bottom and the other is
on the top.

Uwe,

I agree with Mark that this is a great way to add a hard drive to the ST. In fact, I do it right now. :)

I originally had a 1040STe with Mario Becroft's IDE adapter hooked up to IDE->CF adapter made by Ackerman Computer Sciences in Florida (USA). This worked like a charm with HD Driver. In the drive detect boot up screen, it shows "IDE Devices: Unit 0 - Sandisk SDCFB-128" which is my Sandisk 128MB CF card. It's quiet and FAST. I swear everything loads up faster than any hard disk I've hooked up to my ST. (Is this because CF cards are basically RAM disks with memory backups?) Unfortunately, the IDE adapter kept popping out of the CPU socket, so I took it out. :(

I now have an external SCSI Microtech CF drive hooked up via ICD Link 2. It still works though, but now I have external boxes. I can boot up and everything from this drive.

I actually agree with Galen that an external solution would have more appeal since no soldering is involved.

But since it looks like you're going for an internal solution, I hope whatever IDE adapter you have, make versions for both the ST and STE. I think Keychange still sells the IDEal STE IDE adapter, so it's really the ST owners that are hard drive adapter-less. I'm always hoping some clever hacker here could fill that void.

-Phil

It's easy to build an IDE CF adapter, you need just connectors, a test board, lot of wires, good fingers, and lot free time for solder...
http://perso.wanadoo.fr/didierm/jpg/cf_h.jpg
and the original schema:
http://members.optushome.com.au/jekent/ss30ide/Cf_ide.pdf
Sure you cannot remove the CF without cut the power because the IDE port on a Falcon is his bus.
I have also patched the tos4.04 for boot on an IDE slave. There are a little difference with an ide drive, the command identify device ($ec) return at word 0 (general configuration) the value $848a.

Regards,

Didier.

Good general advice, but IIRC the NVRAM chip has its pins coming from
below its casing and so they aren't exposed. ICBW of course!

Mark,
I emailed him the other day, he said 30 euros if you dont need a SIMM,
and yes he tests the cards with the SIMMS at 25mhz (but if you use
your own SIMM obviously its a risk).

Coda.

Atari 4mb RAM card is no good for 25mhz. Im surprised it works at 20.

Coda.

Don't fap about with it, get a decent sized soldering iron and some fresh
desolder braid, extract all the solder you can then gently ease the device
from the board, reheat any legs that appear to be sticking the device in
place. Fit a socket as you suggested, plug in the new device. This should
take you a matter of minutes to do.

What about soldering pump, will that suck all solder as well?

Janez

You should have a look on my web site some times :
The Paskud card is referenced ! But the quality is poor (see the
pictures)...not very nice PCB..
This new one is better...even if I think that traces are not
optimized....but I am a perfectionist ;-)

I don't like desolder pumps, cheap one's cause static problems, one suck and
the board is fried!.

5023. CTLink for VME machines : need help from YOU

Newsgroup: comp.sys.atari.st
Date: 2004-10-03 10:32:10 UTC
From: Rodolphe Czuba <rod-yenamarreduspam-olphe.czuba@free.fr>
Message-ID: <415fd518$0$7199$626a14ce@news.free.fr>
Source record: 16918

This email is ONLY for people who use a MSTE or TT.

I need your help :

FIRST,
to open your MSTE and TT and check inside if the 2 ribbon cables using connectors on a small vertical PCB (the VME back plane) ?

Please check the following photos :
http://www.czuba-tech.com/CTLink/TT_motherboard.jpg (177KB)
http://www.czuba-tech.com/CTLink/VME_ribbon cables.jpg (128KB)
http://www.czuba-tech.com/CTLink/VME_back plane.jpg (134KB)
http://www.czuba-tech.com/CTLink/TT_Rear.jpg (101 KB)

This is a TT, but the VME of the MSTE is identical...

What I want to be sure, is that all atari VME machines use the same ribbon cables to connect mb to VME back panel... I think some machines may have soldered ribbon cables (cannot be unplugged !).

The idea is to connect BETWEEN the ribbon cables and the VME back panel a new small board that will furnish a second VME port for the CTLink.

SECOND, :
tell me if you have a VME board installed into the machine.
If you have one, tell me what it is (model & function : graphical card by example).

I will have a problem with double VME use : the interrupt level.
If I use the same one that your VME board, it is bad and there is no way to daisy chain the INT ACK signals to prioritize the INT.
This means that I will have to use an INT level that is never used by the other VME boards you may already use...
I want to avoid the stupid jumpers...

Leter, I will ask to one of you to check some traces on your VME board...especially the IRQ lines to determine which is used (may be 6 or 5 or less ?).
Let me know if you are able to follow a trace with your eyes or a multi-meter ...

PS : I have a guy that will send me a CRAZY DOTS...
I need info for other boards...

Thanks a lot...

Hi, Rodolphe!

RC> check inside if the 2 ribbon cables using connectors on a small
RC> vertical PCB (the VME back plane) ?

The VME plug PCBs in my TTs and in my MSTes all have connectors for ribbon cable plugs, 50 pins each.

RC> The idea is to connect BETWEEN the ribbon cables and the VME back
RC> panel a new small board that will furnish a second VME port for the
RC> CTLink.

Axel Gehringer once sold so-called "VME-Doppler" kits for all Atari VME machines. It consisted of a used VME plug PCB and two 50 wire ribbon cables with one male and two female plugs, so I think, this was kind of standard.

RC> tell me if you have a VME board installed into the machine.

Yes.

RC> If you have one, tell me what it is (model & function : graphical card by
RC> example).

PAMs ethernet cards,
SuperNova graphics cards.

RC> I will have a problem with double VME use : the interrupt level.

That's probably the reason for my SuperNova not to cooperate with the PAMs Ethernet card. I have such an "VME-Doppler", but it did not prove useful for my intended configuration.

RC> This means that I will have to use an INT level that is never used by
RC> the other VME boards you may already use...

Sounds like there is no way to fix my problem (above) by software? I thought about having a look at the NOVA-VDI sources and check it for address collisions with the MiNT-Net sources (this idea is quiet old now... and still undone).

RC> I want to avoid the stupid jumpers...

Then go for DIP-switches ;-)

SCNR. If you find an unused interrupt level, it's ok to use it fixated by the hardware. But I prefer to keep things as configurable as possible (and reasonable).

Regards,

Alexander

Nice to know about the VME doppler !

But my idea will be other...I want to furnish a Falcon bus to allow to
connect Falcon products on TT & MSTE !

I want to produce only one model of CTLink...a falcon model...
And my VMEF30 board will allow to connect a CTLink on the TT & MSTE...at the
rear and out of the case sure...

If there is a INT problem with your two boards...one of them should change
the IRQ....

On the VME of the boards :

IRQ1 = pin B30
IRQ2 = pin B29
..... up to...
IRQ7 = pin B24

Can you check the pins B30 to B24 and see the one that have a trace routed
for each of your board ?

Regards

Hi, Rodolphe!

RC> Nice to know about the VME doppler !

Nice to tell you something new ;-)

RC> But my idea will be other...I want to furnish a Falcon bus to allow to
RC> connect Falcon products on TT & MSTE !

I know. But as you don't plan to block the VME plug your Falcon bus PCB
will find it's place between TT/MSTe main PCB and the VME plug PCB - in
the same manner the VME doppler does.

RC> I want to produce only one model of CTLink...a falcon model... And my
RC> VMEF30 board will allow to connect a CTLink on the TT & MSTE...at the
RC> rear and out of the case sure...

That does not matter. At least for the SuperNova there is an external box
necessary as well: it consists of an VME-to-ISA adaptor PCB that plugs
into the VME bus slot, while the graphics card itself is a ATI MACH64 (ISA
model) that is housed in the external case.

RC> If there is a INT problem with your two boards...one of them should
RC> change the IRQ....

Actually I have no clue about the reason.

RC> On the VME of the boards :
RC>
RC> IRQ1 = pin B30
RC> IRQ2 = pin B29
RC> ..... up to...
RC> IRQ7 = pin B24
RC>
RC> Can you check the pins B30 to B24 and see the one that have a trace routed
RC> for each of your board ?

Well, the IRQx pins are routed from the VME plug to the ribbon cable
connectors (easy to check, as the PCB is not in use currently).

I'm too lazy at the moment to deconstruct the tower-high assembly below my
desk, so I had a look into the "Atari Profibuch ST-STE-TT". This is my
favourite source for answers to hardware questions.

First the authors state that the VME bus implementation is identical for
all TTs and MSTes. From the schematics I can see that all seven IRQ
signals are connected to dedicated pins in the SCU. IRQs 3, 5 and 6 can be
generated by the board logic as well (3 by software, 5 by SCC, 6 by MFPs).

In the text it is said that the (low active) IRQs have 1k pull-ups, as well as (low active) SYSFAIL, which causes a level 7 interrupt.

The text gives a lot more information about the interrupt vectors and such stuff. I don't want to translate all of it so just ask for the information that you need and I'll hopefully find it in the book.

Regards,

Alexander

5030. Add your classic gaming or classic computer web site to 8bitclassics.com Links!

Newsgroup: comp.sys.atari.st
Date: 2004-10-04 00:49:22 UTC
From: 8-Bit Classics <nospam@8bitclassics.com>
Message-ID: <972pj0he9tits34vfp95di8oj97unk4un7@4ax.com>
Source record: 16925
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari,comp.sys.atari.st,comp.sys.cbm,comp.sys.ti

Do you have a classic gaming website? Would you like to move up higher on a Google or Yahoo search? Add your website to your Links page! Simple to do, just fill out the simple form and submit your link. I will review it to make sure it fits in at 8-Bit Classics. If it does, your link should be approved soon. On the form it does mention the requirement for cross linking 8bitclassics.com on your page someplace. This isn't a requirement, just something that would be appreciated :) Just fill in your normal URL if you won't be cross linking with 8-Bit Classics.

If I get many of a certain category (like Amiga, ST, or TI), I will create a new category for them and move them.

Go to: www.8bitclassics.com and click on the Links link on the bottom.

OK some nice people told me the IRQ info for the following products :

Matrix COCO 256
Matrix MICO
Matrix TC1208

These 3 boards use IRQ4.

NOVA MACH 64 (SuperNova)
AlberTT

NO IRQ used

If you have other VME boards, thank you...

I need to produce some floppy PCB's, though to lazy to make them by hand so I am looking to get them made. I will have to get about 50 or more made, so if anyone is interested I will take orders for them, this is for PCB only, I can build or supply parts, but better for you for lower cost to make yourself.

info at. for the module is 3rd pic down I think..

i've had a luck to test it, this is the best card i've ever seen,
boosted bus (25 mhz), ct60 and all works without any pixel flickering.
i'm owner of paskud's ram card, that difference is very noticable.

It's down for about 12 hours so far now. I broke my TT last night and I
have to get it fixed up. Just a basic boot order/NVDI problem with the
supernova so it shouldn't take me too long to get things correct tonight.
If I can't get it working, I'll move it over to my falcon or MSTe.

Thanks,
Mark

If you will ship to the USA, I will take four PCB, and will probably want
parts supplied, since for me to get small quantities of parts costs more
in minimum order charges than for postage.

Yours is the neatest and most rugged implimentation of a 16MHz floppy
circuit I have ever seen. Nice work.

Well,

Compatibility isn't as good on a CT60 Falcon as on a stock Falcon, but
my haphazard testing has showed that quite a few games will run in
CT60 mode. (I didn't keep a list.) Of course, one of the nice things
about a CT60 is that it can be turned off.

You don't have to sell the hardware yourself. I haven't wanted to
spend the money to experiment with the IDE bus, but if you said "I
have this combination of hardware working with HDDriver x.xx" I would
likely pick up the hardware and upgrade HDDriver just to have some fun
tinkering.

How can I determine what the IRQ line is ???

It it can helps you, I "scanned" the board:
http://dbug.hd.free.fr/_atari_/

Picture are saved in two different resolutions, "small" ones are 400k large,
"normal" ones are 4megs large:

http://dbug.hd.free.fr/_atari_/spektrum_bottom.jpg
http://dbug.hd.free.fr/_atari_/spektrum_bottom_small.jpg

http://dbug.hd.free.fr/_atari_/spektrum_top.jpg
http://dbug.hd.free.fr/_atari_/spektrum_top_small.jpg

Feel free to ask any more questions.

Hi Chris,
Is there a problem with your links? I tried around 3am Tuesday (USA
Eastern time). Also, can your board be used in a Falcon? I have a Falcon
motherboard with the floppy circuit traces ripped out!!!

John

YES I KNOW.

IRQs 3, 5 and
> 6 can be generated by the board logic as well (3 by software, 5 by
> SCC, 6 by MFPs).

YES I KNOW. Those infos are coming from the TT/X confidential release ..I
have.
I should scan and online this : it is nice to read ;-)

> In the text it is said that the (low active) IRQs have 1k pull-ups, as
> well as (low active) SYSFAIL, which causes a level 7 interrupt.

ok, I will never use IRQ7...
Traditionnaly on 68K systems, the IRQ7 (NMI) is reserved for hardware
debugging...

> The text gives a lot more information about the interrupt vectors and
> such stuff. I don't want to translate all of it so just ask for the

ok maybe scanning, OCRing and using a translation motor like altavista on
the net ?

Hi, my website is down it seems, along with my E-mail, and hell, even the
host server's website is down, somethings had a majour death sometime
lastnight :(

keep trying, hopefully it wont be down too long!

What do you mean your falcon traces are cut ???? if your floppy dont work
then my board wont help, infact there would be no use in fitting to a falcon
which already supports 1.44......

Chris

Cant see clearly the traces near the connector from the top view...
There is a trace running between pins 31-30, and 29-28. If one of
these stops on a pin on the middle row (Row B) from 30-25 then that is
an interupt line.

Coda.

I think the wizztronics boards cost a little more, and I've been told that they aren't the greatest engineering. Apparently these ST-ram cards are extremely sensitive to trace length, etc. The possibility exists that when all is said and done, after your falcon is boosted, it may not work properly at 25MHz, but I will try some different SIMMS if that's the case. Hopefully there's some workable solution.

Thanks,
Mark

Hmm, thats odd. Steve Cohen and crowd are usually very fast to respond
from my experience (2-3 days on e-mails usually).

Have you tried calling them directly? Their number is:

631-473-2507

I just bought their Rack case not too long ago, and they were very helpful
after the purchase.

5065. IDEal and CF cards.

Newsgroup: comp.sys.atari.st
Date: 2004-10-05 15:06:06 UTC
From: Barrie at Keychange <barrie@keychange.co.uk>
Message-ID: <yLy8d.24$In1.10@newsfe2-gui.ntli.net>
Source record: 16860

Hello.

We will be testing the IDEal interface and compact flash cards this week.

If we judge it a viable package we will consider producing another batch of the IDEal interface.

We are looking at 50 as a minimum production run AND will require 30 PAID UP orders.

Promises don't pay for PCBs.

The price for the IDEal will be about £60 GB pounds.

Card and adaptor TBA or buy your own at your own risk.

For info. The IDEal is designed to fit only STE machines with socketed 68000.

You solder to a surface mount 68000 at your own risk

Given the numbers of STEs on the market prospective customers can buy an STE to use with

the IDEal/CF card and use their old FM as a spare

If you are interested in the package email me at *** keychange@ntlworld.com *** to indicate initial interest.

I had big troubles with wizztronics card on CT2 machine. Tried few
simms and none was okay. On end i got me OxO designs ramcard and all
is okay now..

Hello Andy,

> I hadn't realised that virtual consoles had been added to
> MiNT. Is there a reason that they're not in the 1.16.0
> beta?

Virtual consoles are part of MiNT for ages, but they werent added to EasyMiNT distribution, since they make some probs with applications running in supervisor mode (aka Apex media and such) making keyboard input not working in those apps if vconsoles are active. Vcons are not part of kernel, but as separate driver. MiNT 1.16.0 freezes in matter of minutes with vconsoles driver, i guess due to changed interrupt handler maybe. 1.16 alpha from late January works fine. Between January and official beta release i didnt compile kernels, so i dont know when exactly problem occued.

Btw, i did make easy to install vconsoles package for EasyMiNT, so they arent hard to add, and they are switchable in /etc/rc.d/rc.local so they can be switched off.

Source record: 16866

> Have a look on the PCB : pins IRQ7 to 1 !
> I gave the pin numbers here...

Sure, I saw this, but you should consider that not every people have the same knowledge in electronic than you.
I finaly googled to find a picture of the VME connector, with numbering, to figure that B30 to B24 where on the middle row, and that the first column was indicated by the small "triangle" symbol.

If the pins you where talking about are the ones I indicated here:

http://dbug.hd.free.fr/_atari_/spektrum_connector.jpg [230 k]
http://dbug.hd.free.fr/_atari_/spektrum_connector_small.jpg [30k]

then I can tell you there is absolutely no line on the board that connect these pins to anything.

I suppose this means this Spektrum card does not use any IRQ ???

Dbug (very bad in electronics, that wonders what means "pcb" :p)

I recently got a Falcon Rack from him as well (UPS dropped on 09/22)
I also had trouble getting ahold of him via e-mail..so I called and
he still there :) very helpful too

The link are not working ?

Ok no IRQ on the board

Can you check pin A20 & A21 for me ???

It is IACK & IACKO

Thanks

Hi guys. I've got Imagecopy, running on my Falcon, and I want to convert a JPG picture to a format (IMG?) that I can use as a background for the Thing desktop.

I have no problem converting it - but it always comes out "washed out", and the colors don't look right.

Anyone got a howto, or directions on how to make it convert down to a 256/8bit, 640x480 or 800x600 picture that will display correctly?

Thanks much!

Krylon has Fusion paint for plastics. Works very well but the only black
Fusion they sell, at Wal-Mart anyway, is a semi(at least) glossy finish.
I've done a couple of CD/DVD drive fronts. Just cleaned the beige plastic
with 90% alcohol first. Its glossier than my case but is hardly noticeable
especially compared to the beige.

Another option might be automotive vinyl dye. A google search would bring up
articles. I've not used it myself.

Hm, the Wizztronics board isn't the best, but I'd been told it was the
next best to Centek board. It has worked fine on both my CT2B and
CT60.

I had similar CT2 issues, with Ram on my Actionsoft card. I had the odd stray pixel. I was beginig to think it was the Videl taking offence at being overclocked. As fate would have it, last week I put an 16MB EDO chip in and Voila. Problem solved. It is also running alot happier. I was always under the impression that EDO was no good for your Atari, and fastpage was the way to go. Oh well. If it works.

5081. Atari ST Internal IDE Interface POLL

Newsgroup: comp.sys.atari.st
Date: 2004-10-06 05:48:19 UTC
From: Atari Only <atarionly@adelphia.net>
Message-ID: <AsydnZ4zbJi-Gv7cRVn-tQ@adelphia.com>
Source record: 16876

I recently have noticed a renewed interest in a Atari ST IDE interface. What Im looking for is who would be interested in purchasing a IDE Interface for their Atari ST.

Questions:

1) Which ST (i.e. STF, STE,Mega, or STFM) would you be installing the interface in?
2) Do you have TOS 2.06 or would you also need a TOS upgrade?
3) Would you install the interface yourself or need someone to install it?
4) Would you install inside the ST case or external?
5) Would you be willing to pay a deposit far a interface?
6) Where are you located?
7) How many would you order?
8) How is the price of $120 US Dollars shipping included in the USA?
9) Would you need Hard drive software?

The STE version simply plugs into most STEs.

If you feel this is something that you need or interested in please answer the above questions.

You can email me or post your answers here for all to read.

And maybe you will get one, because I sure want one! :)
I just need to get the EtherNat and the SuperVidel finished first. And the EtherNat is well on its way (and the SuperVidel isn't that hard to route anymore...). I've received my VAT-registration proof now! :)
Just need to switch the RJ45 connector to an "integrated" version (~two hours work), before the prototype boards can be manufactured. That will probably be done this weekend.

A faster IDE controller would also be required to watch DVDs on the SuperVidel...

Put your original JPG on a website or email it to me and I'll play
with it. Odds are that your Imagecopy settings are wrong. I've often
converted TO JPG without trouble, so I'd like to see if I can get your
image FROM JPG working.

Hmmm, it seems that pin A21 is connected to pin A22 (on the bottom side),
but that they are not connected to anything else. Does it makes sense ?
A20 does not seem connected to anything.

Check and make sure it's not a multilayer board. Look through
the board using a bright light source and you might find otherwise.
;-)

Hi, Rodolphe!

I was out of house for the last two days, therefore my late reply.

RC> YES I KNOW.
[...]
RC> YES I KNOW. Those infos are coming from the TT/X confidential release
RC> ..I have.

Does that mean that you want this information to be validated by checking
the wiring of real TT/MSTe boards?

RC> ok, I will never use IRQ7...
RC> Traditionnaly on 68K systems, the IRQ7 (NMI) is reserved for hardware
RC> debugging...

I know ;-)
I mentioned it only to make the IRQ wiring sketch complete.

RC> ok maybe scanning, OCRing and using a translation motor like altavista
RC> on the net ?

If you want all of it, I'll translate all of it. Just takes a while...

Regards,

Alexander

Well I'm looking at the memory/ide upgrade from STLabs for my Mega
STE.. If he doesn't release his i would be interested in a plug and go
ide interface..altho it may be overkill if Rodolphe comes out with
the CTlink for the VME then would prolly go for an external USB hard
drive. The main thing that interest me in the STLabs offering is the
memory upgrade.

Yes indeed I am the distributer. As soon as I get them in I will be selling
them here in the US, I got about 5 replies already so whoever replied you
will get one. I have not got a final price setup yet, will have to figure
in shipping costs, etc. I am told they will all come with a 16MB SIMM
installed.

What is the benefit of this board over the Wizztronics board? I am asking because I've had the Wizztronics board for quite awhile now and haven't any problems with it. Of course, I don't know how it will behave with the CT60, but I can't imagine there will be any problems.

I too have been watching the status of that project but its taking a bit.
Since its a big project. This unit that I may reproduce will be available
right after manafacturing. Its already been tested.

Thomas,

Sure there will be a VME CTlink solution, because its only going to be
a VME =>CT60 bus adapter, its very simple to make. But I think that a
USB hard drive on the platform is probably the wrong answer for most
people... USB flash drives (pens, dongles what have you) - these days
they have lots of capacity for little money (and this ratio is
improving all the time obviously), theyre small and have no moving
parts (see the Compact flash=>IDE thread). On the other hand, small
capacity hard drives are abundant, and cheap (if not free), but you
have to consider their size, noise, power requirements and the cost of
the USB housing also.
I personally will be buying a USB compact flash pen and a 512Mb or 1GB
CF card, this gives me the greatest flexibility of file transfer
between my laptop (also PCMCIA - CF card adapters are about ï¿½5/$7), my
digital camera, and my MP3 player.

Coda.

Replace with TOS 2.6 is better.

- push the DIP switch #6 (0 to 7) under the HDD place on the mb ! The 1.44 button will appear now in your format menu of the tos !
- check UA10 GAL on the mb : if ref finish by -001, it is bad. You need -002 model.
- the first mb have a bug : a trace is not here and a wire must be added up to a pin of UA10.

Nothing else.

Rodolphe

NO, and I already did that several years ago ;-)

TTX was announced VME 32-bit and MASTER capabilities !
VME on TT & MSTE are only SLAVE with A24/D16 bits !

> makes sense ? A20 does not seem connected to anything.

are you sure ??
Can you check again the #... be sure it is well A21 & 22, not A20 & 21 ?

Because pin #A22 is not used on ATARI VME slot !
It is on the VME specifications, not on atari !
It is used then you want to daisy-chain the IACK from one board to an other
in back plane box ...

Regards
```

HI all,

Somewhere I was looking at a page which had the wires soldered form the IDE cable to the blitter chip area on the STFM. I dont think there was anything IC's involved but can't remember, I've seen a couple of similar ones which use 3 IC's on the ribbom cable.

Does anyone have any ideas on this ? I would be very interested in connecting to the blitter area for a internal IDE drive! if anyone has link me back up with such pages then that would be great!

Chris

> Can you check again the #... be sure it is well A21 & 22, not A20 & 21 ?

Well, can you check by yourself on the picture:

http://82.227.114.122/_atari_/spektrum_pinout.jpg

If I'm not wrong, the red rectangles are around what you asked me, and
obviously pin A21 is connected with ping A22

> Because pin #A22 is not used on ATARI VME slot !
> It is on the VME specifications, not on atari !
> It is used then you want to daisy-chain the IACK from one board to an
other
> in back plane box ...
>
> Regards

Well, perhaps the Specktrum card was design in a way it can be used with
some other VME boards but does not need that IACK stuff for itself ?

Another possibility is that I didn't get 1-32 and A-C direction right, but I
don't think so, at least I hope.

It's why I put pictures => I'm very dumb when it's about electronics.

Dbug

I have a Mega 2 that I would like to put an IDE interface in.

> >>> 2) Do you have TOS 2.06 or would you also need a TOS upgrade?

No, I just use a boot disk in my STE. I guess a TOS interface would be nice.

> >>> 3) Would you install the interface yourself or need someone to install
> >>> it?

The beast has a soldered in DIL CPU. The need to mess with this has put
me off messing. Depending on how hard the mod is I would probably do myself.

> >>> 4) Would you install inside the ST case or external?

Inside

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Hardware, Games/ Software, Books and Accessories! Classic Atari 8 Bit and Atari ST Computers Plus Atari Jaguar Games! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!!! http://www.aracnet.com/~atari/catalogs.html Click Here to Save!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

The ATARI ST is the No.1 worms- and virus- sender , script-kiddies use
this system to send malicious programs around the world.

It's only a matter of time, the US government will declare all
remaining ATARI STs WMDs and the FBI will collect them all.

Likewise I'm waiting on the STLabs project, as the memory upgrade is a
big plus, esp. if there is CPU acceleration as well. If it doesn't
make it to market though I'd be interested in taking one of these.

I took a photo of the connector, to show the small numbers and letter that identify row and columns (actually I didn't noticed them the first day... shame on me):

http://82.227.114.122/_atari_/spektrum_numbers.jpg [405k]
http://82.227.114.122/_atari_/spektrum_numbers_small.jpg [48k]

So considering this pictures show the bottom of the card:
http://82.227.114.122/_atari_/spektrum_pinout_small.jpg

the screw we saw on the left of this picture is the one we saw on the other picture.
does it makes sense ?

Dbug (turnin around the card with a totaly perplexified frown on the forehead)

Amiga was famous for it's 'bootblock' viruses, I remember back in the 80's
the SCA virus even made the UK news at ten... Ahh the good old days ;-)

ST's were relatively safe....

http://www.cps-electronics.co.uk/144/HD4.htm

There has already been some reserves, There will be 30 manufactured PCB's,
First come first served basis.

Order now on paypal to reserve your parts.

PCB and parts will arrive in about 2 weeks from manufacture.

Should there be more than 30 orders, then I will consider a second batch,
orders must be 30 or more in each case.

Chris

What's so unclear? The photos show a prototype PCB with some ICs on it (seen
from the bottom) that is wired to the IDE cable - what makes you think it
does not match the schematic on the same site?

Furthermore, he links to
http://members.tripod.com/~piters/atari/astide.htm
where you find another schematic with GAL listings etc., which on a first
glance seems to describe a similar circuit, only using a GAL. It seems
Jo'ogn left out the two 74HCT245 bus drivers, which I would not advise when
using longer (ie. more than 5cm) IDE cables.

the "F" and the "0" marked on the left,

the (6) , (9) (35) means nothing ?
the "4 6 10" I assume are pin numbers, but it says LS133 & 4610, might be
4610 IC equiv or connect pins 4 6 10, unclear as to what it means, can't
assuming anything!

Actually what to connect to the IDE seems totally left out, theres just a
image of the connector, nothing to give a start to what solders where, again
can't assume such things. No info it will will work with HD DRiver or needs
anything else... too many unclear things and "assumptions"
What if we dont have TOS 206, nothing to what what to do, maybe its just me,
but I like to know 100% what I am building rather than take chances and
assume or guess to whats needed.

5160. Atari ST software

Newsgroup: comp.sys.atari.st
Date: 2004-10-10 08:06:23 UTC
From: Amigaboy <amigaboy@hi.htnet.hr>
Message-ID: <ckaqfffef1@bagan.srce.hr>
Source record: 16805

I have a couple of questions about Atari ST software:
1.Floppy disks can be read on a classic PC ,right?
2. where can I download software from the web?
3. Can I simply format DD disks on a PC , copy a game on the floppy and play it on a ATARI ST?
Thanks in advance

P.S. Sorry for my bad english (but I`m trying :-))

1. Yes, unless some exotic format is used, a standard "PC" using Windows
or Linux should read them fine.
2. Google search for something like "download free Atari ST game" or
something. You can also get games that are already made up for some of the
Atari emulators like STeem and Hatari. A huge list is at:

http://steem.atari.st/automation.htm

I'm not sure how to convert those back to standard ST disks. Can someone
else here tell how? Thanks.

3. Normally, from TOS 1.4 up, my understanding is that the best way is to
format the DD disk on the Atari. The PC should have no trouble reading it
then. Not sure about TOS versions below 1.4...

PS Your English is fine! :-)

>the "F" and the "0" marked on the left,

Not sure what that's supposed to mean, but the signal names and pin numbers
are clear and sufficient.

>the (6) , (9) (35) means nothing ?

Not sure. However, it does not matter - what counts are the signal names.
Get a ST schematic and see where you can access these signals conveniently -
a good point may vary from board version to board version. I assume you can
get avarything you need at the CPU.

>the "4 6 10" I assume are pin numbers, but it says LS133 & 4610, might be
>4610 IC equiv or connect pins 4 6 10, unclear as to what it means, can't
>assuming anything!

They are clearly pin numbers, since pin 4 6 and 10 and not connected
elsewhere. Since they are inputs, they can not be left floating. However,
instead of connecting them to pin 7, I would rather tie them to VCC using a
resistor.

>Actually what to connect to the IDE seems totally left out, theres just a
>image of the connector, nothing to give a start to what solders where, again
>can't assume such things. No info it will will work with HD DRiver or needs

Then this is probably not the right project for you. This looks more like a
"works-for-me" project than a bulletproof instruction for people who just
want to solder the parts together without understanding what they do.

Since this looks like a stripped-down version of the interface at
http://members.tripod.com/~piters/atari/astide.htm,
I would suggect you build that one, since it looks better documented, has
the buffers in the data lines, and the IORDY logic that is missing in the
Jo'ogn schematic looks like this might work with more disk drives.

>I was going to give that a go, I brought 5 gals to get them programmed but
>seems a bit long winded if it can be done with a couple of logic chips.....

Go with the GAL. Multiple cascaded 74LS in the decode logic may well cause timing problems, and replacing them with 74AC or similar is not something you should attempt on a prototype board without some knowledge in highspeed digital design.

Yes, your English is fine, or at least workable.

The advice given is a bit incomplete. Only Windows 95 can read any Atari disk you might stick in the drive slot. DOS can be set up to read any disk you can stick in that slot. Other than that, format the disk on the Windows machine, and the Atari will read it.

This has been found to work on any version of Windows higher than Windows 95, and even with Dell machines, which seem to want something different than any other machine running Windows.

What you will find is not only what you wanted, but a whole batch of files to support a FAT32 file system. They cause no problems unless you try to erase a disk.

If that is a problem, copy the files you want to a ram disk, or a hard drive, if you have one connected, format the floppy, and copy the files back.

Linux, on the other hand, does follow the Microsoft Boot Sector Standard, which Microsoft does not follow, and should read Atari disks.

Jim

: > Thanks in advance
: >
: > P.S. Sorry for my bad english (but I`m trying :-))

: 1. Yes, unless some exotic format is used, a standard "PC" using Windows
: or Linux should read them fine.
: 2. Google search for something like "download free Atari ST game" or
: something. You can also get games that are already made up for some of the
: Atari emulators like STeem and Hatari. A huge list is at:

: http://steem.atari.st/automation.htm

: I'm not sure how to convert those back to standard ST disks. Can someone
: else here tell how? Thanks.

: 3. Normally, from TOS 1.4 up, my understanding is that the best way is to
: format the DD disk on the Atari. The PC should have no trouble reading it
: then. Not sure about TOS versions below 1.4...

: PS Your English is fine! :-)

You don't need TOS2.06 to use IDE drives, just to boot from them. Load
AHDI 6 on a floppy and boot from that, That is what I do on my STE..

Er, Jim got that right, I had it backwards - do format it on the Windows
'95 PC, then it should be fine for your Atari.

Guess my keyboard dyslexia is showing again! :-)

You can look for a Epson SMD-300 or 340 HD drive, its a drop in replacement.
I have a spare I can sell you.

As others have mentioned here I can be read on a classic PC, in my experiance PC's running DOS, Win 3.x, Win 95, 98 and NT are fine, but my Laptop Running XP wont recognize the Floppy and therefore can't read it.
Has anyone got XP to read 720K floppies? Maybe this is because I am using the BIOS USB driver (as it appears to work) and so have not installed the driver software that came with the USB floppy drive, anyone know if that would make a difference?

Just one thing, when using an Windows OS other than DOS or Win 3.x everytime you copy something to the floppy Windows also places empty files with names like Aa, Bb on the floppy but you can not see them. Eventually these will cause the ST to fail to recognise the floppy. Sometimes by using ST Tools to locate and delete these files will allow you access to the floppy once more but this is only a temperary measure and you will eventually need to re-format the floppy.
I recommend using one ot two floppies for copying file from a PC to ST and then use the ST to copy them to another floppy before you use the downloaded software.

> 2. where can I download software from the web?

The univercity of Michigan arechive is a good place to start, do a web serach for "Atari archives"

> 3. Can I simply format DD disks on a PC , copy a game on the floppy and play
> it on a ATARI ST?

Yes, if it uses the operating systems listed above. When you click the format a box will appear with the format size set to 1.44 as a default, by clicking on this the 720K option should appear just select that and proceed.
Again I am unsure if this is possible using XP as I appear to have no formatting potion selection, its fixed at 1.44, also XP uses a different FAT format from those operating systems listed above (not FAT32), if this new format is also used on floppies I doubt if an ST will be able to access them.

If the program file you download has either a .MSA or .ST file extension it is a disk image file for use with emulators and will need

converting back to a real floppy before you cna use it - look for a program called MakeDisk which allows you to both create and restore disk images.
If the programs have a .ZIP or .LZH they have been compressed using ZIP and Lharc respecively and will need uncompressing before you can use them - ZIP files can be uncompresed using either PC or ST ZIP programs.

If you have TOS<1.4 you will need to format on the PC if you have TOS 1.4 or higher you can format on either machine but on the PC is probably best.

Windows XP has no native support for 720K floppies. It CAN read and
write them (at least on my machine), but it cannot (read WONT) format
them. I downloaded a tool that will format disks of any capacity but I
cant remember the name of it now. You can use that tool in XP to
format the disk if you wish, and then use it on the atari, but to be
honest its probably better to format it on the atari using the
required sectors/tracks and then write it on the PC (If you use
makedisk dont let it try to reformat the disk). Note, that TOS >= 1.4
desktop formats the disk to msdos standard. If you use <=TOS 1.4 then
the disk wont be readable in msdos/windows/xp whatever (a re-iteration
of what you stated already!).

Funny, I was looking at this last night. It seems to be when you copy
files with long filenames onto a disk with windows and try to read it
back on the atari (In my case it was written on my XP laptop onto a
1.44mb floppy to read in my falcon). I think windows is adding entries
in the directory to hold the information for the long filenames which
TOS cannot understand.

ftp://193.190.204.128/atari

There are a few mirrors here of atari ftp sites:

http://storage.atari-source.com/atari/mirrors/

I think thats Mark Duckworth's mirror.

Coda.

Hello Jim,

JDC> Only Windows 95 can read any Atari disk you might
> stick in the drive slot. DOS can be set up to read
> any disk you can stick in that slot.

How does MS Windows 95 treat 3.5" diskettes differently from
DOS? Is it that MS Windows is more ready to work with disks
that use an unusual number of sectors per track, cylinders
per disk etc?

JDC> What you will find is not only what you wanted, but a
> whole batch of files to support a FAT32 file system.

What does FAT32 have to do with floppy disks? Surely they
are usually FAT12?

Windows 95 was Microsoft's last floppy disk distribution of what they call an operating system. It would save one disk per copy if they formatted the disks to 1.62 megs, and to do that, they had to write an operating system that would actually look at the boot sector to find out how many tracks and sectors it had. Windows did not do that before or since, but Atari and other machines always have.

DOS could, and maybe still can, set up a drive letter with separate information as to tracks and sectors. So, to read a disk with that many tracks and sectors, you change directory to that drive letter, and ls or dir will let ou read the disk. For further information, read up on CPM. DOS is CPM with relocating loader, updated as necessary, and absolutely unchanged for a long time.

Floppy disks are not inherently anything. Formatting them gives them a File Address Table. One thing you might learn is that if you put a FAT12 formatted disk into a Windows machine, it will write a FAT32 file system to it, with subdirectory-like files to store 32 character file names. Those subdirectories cause troubles if you are trying to copy disks on an Atari, because TOS does not know about such things.

If you use MiNT, you can make your floppy drive a FAT32 drive, and read Windows disks without problems.

Jim

Message-ID: <pan.2004.10.11.20.16.26.910148@darkforce.ky.org>
Source record: 16821

Okay, I was lucky, I got in on the tail end of the CT60 list and it just came in the mail a few days ago.

Its one with the 50mhz CPU. However, I picked up a 60mhz 68060 off of Ebay. There is a 2nd oscillator in the CT60 package - 66mhz. So, can I just switch out the CPUs and the oscillators?

Next. When I had a Falcon before, I had a Nemesis accelerator installed and I could run an 800x600 desktop, with 256 colors. Can I get extended colors and resolutions with the CT60, or do I have to do the mods on the bus and DSP?

I would definitely like to be able to switch back to "pure" 68030 mode for software that is incompatible with the 68060. Is this very hard? I can solder a little bit, but I don't want to get knee-deep into something thats over my head and beyond my meager skills.

Thanks guys! :-)

TOS 2.06 understand about IDE drives and will autoboot without a floppy but
you still need a Hard Disk driver that understands IDE. I think you can use
HD Driver or AHDI (possibly others).

WOOT!
Grats on getting the CT-60 :)
I still haven't gotten around to recasing my Falcon and installing the
CT yet, still waiting on a few bits before I begin (need the 14mb
upgrade board but on the list for it atm) as soon as i get everthing
here gonna start...then the questions will begin ;P

I have HD8 and that works with IDE on my falcon, will give it a try on my
STE, have to build the interface first! Might try on a old FM to start with
and see how it goes....

If the drive / power supply is internal then it is not a 260ST. The 260ST
looks like the 520ST, in that it is just the keyboard, the PS and floppy are
External only.

Tim

Thanks, I can't wait (itching even!) to get it up and running. :-)

I've already got my Falcon recased into the Wizztronics Rack.

Should not be an issue at all. You might even get lucky and be able to
pick up a 72 mhz. osc. and run your 68060 at 72 mhz. like mine.
Remember overclock at your own risk. But, I have had great success at
72 mhz. Is there anyway of telling whether yours is a E41J mask 1 I
believe.

>

I am sure this would help because this also affects the VIDEL circuit
and makes the VIDEL run at 40 or 50 mhz. Rather than the stock 32 mhz.
But I dont believe that it is necessary. I had Rodolphe do my upgrade
to my Falcon MOBO and CT60 and he was very timely at getting it turned
around. And the speed improvement is noticeable doing the BUS speed
from 16 mhz to 25 mhz. The other advantage is DISK accesses were also
increased. VIDEO and DSP are increased as well as the DISK and of
course the STRam access and Falcon MOBO speed will be higher.

In my experience with the CT60 and my Falcon is if it does not run on a
68060 it must be pretty old software and that I should find a newer
program that does something similar. But if you need to go into 030
mode look on Rodolphe's web page and find where it talks about the PINS
towards the back of the board behind the SDRam module and find the 2

pins that make it possible to bootup in 030 mode. I believe that single row of pins towards the back of that board the first two on the left are for power the next two are for 030 and 060 modes switching

Thanks,
Carey

I'll take a look and see - I did pass a picture of it along to Rodolphe
who seemed to think it was a "good" one. :-)

Well, I was thinking of games and all those cool Falcon demos. :-)

From what I read, this has to be a true on/off switch, and not the
momentary kind?

Thanks.

Yes it has to be a true on/off switch. I hijacked mine from an old PC case that had a turbo switch ;-) These are the right type of switches. In a pinch, a simple pc jumper works just as well.

Thanks,
Mark

Yes, you could do with a "Turbo" switch from an older PC case, or any
switch that latches on/off.

If you are getting a decent SIMM card, then do the with solder upgrade
and use the 25mhz bus upgrade. Its well worth it.

Coda.

From: vdjole@EUnet.yu
Message-ID: <ckh16u$sd4$1@news.eunet.yu>
Source record: 16840

Version 3.40 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit
and 32-bit Atari computers. Developers' goal has been to maintain TeraDesk
as a small, simple, fast and reliable desktop, which would be functional
and competetive in the modern multitasking environments and all flavours
and versions of TOS-compatible operating system(s), while keeping, as
much as reasonable, familiarity with the original TOS desktop.

A number of improvements have been made since the last published version,
and also some bug-fixes. See the history file for details.

Have fun.

Microsoft removed this functionality from MS Windows after
the Windows 95 releases?

JDC> For further information, read up on CPM. DOS is CPM
> with relocating loader, updated as necessary, and
> absolutely unchanged for a long time.

I remember CP/M :-) ISTR DOS remained somewhat CP/M
compatible in its diskette format until PC-DOS 2, when
heirarchical directories were introduced. I'm not sure how
DOS handled information in CP/M user areas: did it just
"see" the files in user area 0?

CP/M's family tree gets sort of odd. DOS was a (probably
illicit) clone of CP/M, but then DOS dragged in heirarchical
directories and i/o redirection from Unix, then DOSPLUS
dragged them in from DOS... I'm guessing TOS and CDOS got
them from DOSPLUS. I should check.

JDC> One thing you might learn is that if you put a FAT12
> formatted disk into a Windows machine, it will write
> a FAT32 file system to it, with subdirectory-like
> files to store 32 character file names.

I'm surprised by that. I had just assumed they used a VFAT
extension on a FAT12 filesystem.

Looking at my notes, I think I had that arse-backwards. DOS
Plus and TOS probably got their heirarchical directories,
i/o redirection etc. from CDOS.

ASB> I'm surprised by that. I had just assumed they used

A couple more questions (just making sure on stuff):
(I have visited Rodolphes' site and looked it over)

1. The floppy drive power cable on the Falcons MB goes to the floppy connector on the CT60, right? (red and blue correctly orientated).

2. My Falcon has a 68882, can it stay or does it have to be removed?

3. The harness (power) from my ATX P/S in my Wizztronics Rack won't reach the connector on the CT60. I've got an extension cable on the way. This should not cause any problems, right?

4. I can't seem to quite get this straight in my head (insults ok here) but does the CT60 *have* to be switched? Or will it come on when you turn the ATX P/S on?

Thanks gang.

5197. Remember this metal Atari ST stand - the "STation" ?

Newsgroup: comp.sys.atari.st
Date: 2004-10-12 22:06:38 UTC

From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <ckhsk1$5nj$1@reader2.panix.com>
Source record: 16841

Some of this I can answer. Yes, the functionality I mentioned was removed after the Windows 95 release. There was nothing illicit about DOS. If one takes a degree in computer science, one learns to write an operation system along the way, as a requirement for graduation. There are of course other ways to learn to write an operating system. One Wally Patterson wrote one capable of dealing with the new Intel chip (8088?) which had four pins for eight bits, and a small memory space, requiring swapping blocks of mimory in and out of its address space, and requiring much low memory to keep track of. He designed it to run CP/M programs on a computer that Seattle Computer Products was building for sale. No, it was not CP/M, but worked exactly like CP/M.

Bill Gates called it PC-DOS, and sold it to IBM for a dollar a copy, when a bottle of pop/soda/soft drink cost a nickle. It stayed unchanged, with nobody working on maintaining it, for at least five years. What was done next was mostly backwards compatible. The rest you know more about than I do. At that time in history, I was probably doing mainframe programming, and never met anything older than Cobol B.

I am wrong on a fairly regular basis. What file system gets written is a determinable fact. Just take an Atari disk, with some files on in, and leave it for more than a moment in the disk drive of a Windows machine. When you take it out it will have a new file system written to it, and if it is a FAT32 extention to a FAT12 file system, you are right. But either way you can now write long file names to it, using either a Windows machine or a MiNT kernal running on Atari.

Jim

Andy Ball <null@not.valid> writes:

: Hello Jim,

: > distribution of what they call an operating system.
: > It would save one disk per copy if they formatted the
: > disks to 1.62 megs, and to do that, they had to write
: > an operating system that would actually look at the
: > boot sector to find out how many tracks and sectors
: > it had. Windows did not do that before or since, but
: > Atari and other machines always have.

: Microsoft removed this functionality from MS Windows after
: the Windows 95 releases?

: JDC> For further information, read up on CPM. DOS is CPM
: > with relocating loader, updated as necessary, and

: > absolutely unchanged for a long time.

: I remember CP/M :-) ISTR DOS remained somewhat CP/M
: compatible in its diskette format until PC-DOS 2, when
: heirarchical directories were introduced. I'm not sure how
: DOS handled information in CP/M user areas: did it just
: "see" the files in user area 0?

: CP/M's family tree gets sort of odd. DOS was a (probably
: illicit) clone of CP/M, but then DOS dragged in heirarchical
: directories and i/o redirection from Unix, then DOSPLUS
: dragged them in from DOS... I'm guessing TOS and CDOS got
: them from DOSPLUS. I should check.

: JDC> One thing you might learn is that if you put a FAT12
: > formatted disk into a Windows machine, it will write
: > a FAT32 file system to it, with subdirectory-like
: > files to store 32 character file names.

: I'm surprised by that. I had just assumed they used a VFAT
: extension on a FAT12 filesystem.

: - Andy Ball.

Yes, but these are getting rarer than hens teeth, and the ECL
technology is not compatible at all with VGA signals. Its easier to
find a VME gfx card, and with most of them you get as good as or
better resolution with colour (I have got my nova so far to
1024x768x16bit stable, not quite 1280x976 though).

Coda.

Hi Classic gaming and Atari-ST fans,

I've created a website about the Atari ST version of "The Great Giana Sisters". The website contains information on stages (now until stage 22!), bonuses, monsters. There is also a clip (audio and video) section. Here is the URI: http://www.markuz.dds.nl/giana/

Hope you'll enjoy it, Mark

5205. New version of Icon Extract (1.50)

Newsgroup: comp.sys.atari.st
Date: 2004-10-13 16:46:04 UTC
From: LAFABRIE Florent <florent@lafabrie.net>
Message-ID: <416d5b5b$0$15749$7a628cd7@news.club-internet.fr>
Source record: 16701

Hello,

New version after a large work (1 year) of research of bugs and insertion of innovations (read below). The treatment can be 70% faster with Magic PC and faster 50% with the CT60. The program is free, but it is necessary to ask me for a code of activation to avoid a panel of 10 seconds temporization. For those which do not know it yet, Icon Extract extracts the icons colors (from 1 to 32 bits) from files ICO, CUR, ANI, ICL, DLL and XPM to safeguard them with format RSC. Remote loading on my site: http://www.lafabrie.net

Minimum: Falcon + accelerating card or PC with Magic PC.
The program is developed on Falcon 030 + CT60 100 MHz + 256 Mo of SDRAM

The program and the list of the innovations are in French. Afflicted, but I do not have enough time for all to translate. I work from now on my website.
Good loading,
Florent

yep, you need to boost the falcon board (videl, dsp, bus) to get extended resolutions, but
don't expect more than 896x640 in 256 col mode at reasonable 70 Hz...
ct60 lets you switch anytime to stock falcon mode, don't worry...
just be careful with soldering part...
good luck

:)

I thought it was Tim?

JDC> ...wrote one capable of dealing with the new Intel
> chip (8088?) which had four pins for eight bits...

What is that supposed to mean? The 8088 was arguably a 16 bit processor (8086 core) with an 8-bit (mostly 8085-compatible) bus interface unit. The 8088 (like everything x86 up to the 80386) could be regarded as an unpleasant cludge of Intel's existing, popular (at the time industry standard), 8080 chip.

JDC> ...and a small memory space, requiring swapping
> blocks of mimory in and out of its address space, and
> requiring much low memory to keep track of.

I'm not sure what you're trying to say there. The 8088 (and anything x86 up to the 80386) was a bitch to program if you wanted to use large blocks of memory, I remember that much.

JDC> He designed it to run CP/M programs on a computer
> that Seattle Computer Products was building for sale.
> No, it was not CP/M, but worked exactly like CP/M.

Right, he cloned CP/M, almost certainly without permission from D.R, hence my use of the term "possibly illicit". Let's give him the benefit of the doubt though, and just call his DOS an interesting response to DR's expensive CP/M-86 licence fees.

JDC> What file system gets written is a determinable fact.
> Just take an Atari disk, with some files on in, and

> a Windows machine. When you take it out it will have
> a new file system written to it, and if it is a FAT32
> extention to a FAT12 file system, you are right.

I never said that. I said that I thought it might be a VFAT extension to the FAT12 filesystem. VFAT != FAT32 afaik. I

should break out the hex editor and have a look though.

I think if you boot linux with the atari filesystem driver in the
kernel (or module?) you can read the disk. Then use 'dd' to make an
image of the drive, which you can then mount with Aranym. This is the
long way round, im sure there is a quicker way.

Coda.

Hello Jim,

JDC> ...I think I at least came close on the chip number.
> That design, an eight bit chip with four data pins is
> where the choice of big endian and small endian came
> from.

It sounds as though you are confusing the 8088 with the 8008 (understandable in view of the numbering).

JDC> As I dimly recall, our topic happened before 16 bit
> word lengths.

No, the PDP-11 had been around for years and even the 8086 had been around for some time. The 8080 and 8085 were both able to work with 16-bit words by pairing registers (BC, DE, & HL), but they are generally considered 8-bit chips. The classification gets a bit muddy: what counts as a 16-bit CPU? One with a 16-bit external data bus? That would rule out the 8088 and 68008. 16-bit register capability? Then why don't the 8080, 8085 and Z80 qualify? Perhaps it's down to how wide the data path is inside the core, that seems a little tenuous though.

JDC> History is interesting. Truth is stranger than
> fiction.

I'll second both of those. :-)

...I didn't see anyone recommending KickOff 2 and all the subsets like
Player Manager, Final Whistle etc that interchange with KO2.

I have a couple of third party editors that allow teams to be cut and
pasted from Player Manger to KO2 and also an editor that allows you to
create your own teams with names and specific player attributes and
port them into KO2.

KO2 is really fast on the Atari ST and brilliant fun if you like
football. The best 'PC' game ever for me and I have spent hours and
hours playing it an Player Manager in particular.

The other basic but fun game is RISKY - a Dutch version of the great
board game RISK. I play this on my PC laptop under an ST emulator also
as it is mouse/trackpoint driven. This is such a good time killer!

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Hardware, Games/ Software, Books and Accessories! Classic Atari 8 Bit and Atari ST Computers Plus Atari Jaguar Games! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!!! http://www.aracnet.com/~atari/catalogs.html Click Here to Save!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

5221. Vintage Computer Festival 7.0 - Nov. 6-7 [*** NERD HEAVEN!!! ***]

Newsgroup: comp.sys.atari.st
Date: 2004-10-15 12:52:26 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <eKPbd.251743$D%.34890@attbi_s51>
Source record: 16720

Vintage Computer Festival 7.0
Saturday, November 6 through Sunday, November 7
Computer History Museum
Mountain VIiew, California

Since the last VCF, the trials and tribulations of daily life made their inevitability painfully attendant: bills came due, accidents happened, bad days at the office were had, arguments broke out, and the morning paper was thrown into the sprinklers yet again. Woe is us! But lo, a bright and shining beacon of nerdilicious salvation is on the horizon and draws nigh. The Vintage Computer Festival returns!

Vintage Computer Festival 7.0 is right around the corner, taking place on November 6-7 at the Computer History Museum in Mountain View in (still) sunny California. Flights are cheap and so is the admission, so you have little excuse to stay home cramped behind your computer trying in vain to craft that perfect Google search term. Just put all that nonsense behind you and join us for some fanatical Festival folly!

We are honored to once again have the Computer History Museum as our sponsor!

And as always, we bring you yet another wonderful line-up of speakers, exhibitors, and special events, including a 30th anniversary retro-spective of Maze War, the original "first-person shooter" videogame, plus so much more!

In fact, we're planning so much for this year's event, it might possibly be even too much! Some of it we can't even mention yet because we're still in the middle of planning it. So come on out and watch us put on a gargantuan geek gala guaranteed to gasify your gall bladder...either that or watch us crash and burn in spectacular style. Either way, it's sure to be entertaining!

Exhibitors Wanted!!!

One of the best ways to enjoy the VCF is by participating directly. Be an exhibitor! As an exhibitor, you get to be a part of all the behind-the-scenes action. Plus you get a chance to show off your favorite computer and perhaps even win an award for an outstanding exhibit. The Best of Show award includes as a prize the Replica 1, a software compatible re-creation of the legendary Apple-1 computer, courtesy of its creator, Vince Briel. So don't delay, sign up today!

http://www.vintage.org/2004/main/exhibit.php

More information about Vince Briel's Replica 1 can be found on his website:

http://home.comcast.net/~vbriel/

We've Got Lodging!

For out of town guests, the VCF has arranged a hotel room block at the Residence Inn Palto Alto Mountain View, located within 3 miles of the Computer History Museum and featuing, among other fine amenities, an on-demand shuttle service between the Inn and the Computer History Museum. The special VCF rate is US$79 per night. Reservations must be made by October 15 to take advantange of this terrific rate so do not delay! Full details are available here:

http://www.vintage.org/2004/main/lodging.php

Computer History Galore!

The VCF speaker schedule has moved back to a "track" style this year. The talks are assembled into themes for the most part. We've got another terrific line-up! Check it out:

Saturday, November 6

Track 01

Time	Topic	Speaker
10:00am	Using Vintage Computers in Forensics	Fred Cohen
11:00am	Documenting the BBS	Jason Scott
12:00pm	The Art of Textmode	Christian Wirth
1:00pm	History of FidoNet	Tom Jennings

Track 10

Time	Topic	Speaker
11:30am	Confessions of an Entrepreneur	Dr. Robert Suding
12:30pm	VCF Ramblings	Sellam Ismail
1:00pm	Computer History Museum Update	CHM Staff

Sunday, November 7

Track 01

Time	Topic	Speaker
10:00am	Early IBM History	John Sailors
11:00am	The IBM 360 Evolution and Revolution	Jerome Svigals
12:00pm	Early Microprocessor Design	Nick Tredennick
1:00pm	Maze War Retrospective	Panel

Track 10

Time Topic Speaker
------- ------------------------------------ ------------------
10:30am Things You May Not Know... Evan Koblentz
11:30am Tipping Sacred Cows Tom Jennings
12:30am The Art of Vintage Computers Christine Finn
1:30pm Neo-Retro: The XGameStation Andre LaMothe

More information on the VCF 7.0 speakers can be found here:

http://www.vintage.org/2004/main/speaker.php

BBS Documentary Screening

Jason Scott, proprietor of textfiles.com--the Internet's largest collection of historic textfiles--has completed work on his BBS documentary. "BBS: The Documentary" spans across seven separate films which cover every aspect of the world of bulletin board systems, tracing the history of the BBS as well as the historic figures that made it a distinctly unique mode of digital communication. This will be the first public screening of the documentary, and audience input from VCF attendees will determine the final cut of the film series. More information on the screening can be found here:

http://www.vintage.org/2004/main/screening.php

Computer History Museum Tours

As always, the Computer History Museum's terrific staff will be giving VCF attendees tours of the Museum's fantastic collection. Tours are held in the afternoon and run every half an hour. Tour information is available here:

http://www.vintage.org/2004/main/tours.php

Buy, Sell and Trade at the VCF Marketplace

As always, one of the most exciting aspects of the VCF is the Marketplace, where you can find a large and varied assortment of some of the most fantastical old computer thingies anywhere. Find that odd part you've been seeking out for your collection, then touch, smell, even taste it if you like, before haggling out a deal. There is simply no better place to buy and sell vintage computers than at the VCF Marketplace. Vendor booths are still available. For more information on selling at VCF 7.0, please visit:

http://www.vintage.org/2004/main/vendor.php

The VCF 7.0 BBS is Live!

Communicate with fellow VCF 7.0 attendees on the VCF 7.0 BBS! Set up trades and carpools, talk about exhibiting, and discuss generally anything about the upcoming Festival:

http://www.vintage.org/2004/main/bbs.php

So Much More!

Complete information about VCF 7.0, including the speaker schedule and exhibit roster, as well as lodging information and driving directions, can be found on the VCF 7.0 web pages:

http://www.vintage.org/2004/main/

Keep in mind that the VCF will from now on be held during the first weekend in November.

;)

I'm not sure Andrew. I'd send an e-mail to Rodolphe (go to his website for the address) and see.

I did that, had my name put on a waiting list. Apparently, someone who had signed up, failed to come through in a timely manner on payment so I got in. I just received mine about 2 weeks ago. Note that its the 50mhz model, not the 66mhz model. I think Rodolphe is having a hard time finding CPUs now.

Anyways, send an e-mail to him - you never know - you might get lucky - I did! :-)

There are many ways you can build one, true you can take 16mz from MB, but I didnt want to do this, I think I had problems with 16mhz, but its also another wire which I didnt want, plus many do use GAL, since I dont have a gal programmer I can't do anyway ;-)
I've been fitting these for some years now also.

But I am interested on how you solved the 1.5ms step rate problem ? I never found a good way on the internet to do this, all required software to work, I didnt like this since I had to boot from a floppy, and when I lost the floppy I couldn't use 1.44 anymore, so I designed a board which didnt need any software, ive never seen anyother design which do this so it will be interesting to see how you solved it!

You could contact Rodolphe, but I wouldn't get my hopes too high. Last
I heard, they were all spoken for, plus a few people on a waiting list
in case the spoken-for ones weren't purchased. I luckily just got mine
in the mail, though! (not to rub it in or anything...) :)

I actually did send off a mail to his address and didn't receive a
response (although it's been only a few days--call me impatient!).

I notice he posts here, though. Rodolphe, if you're reading this,
can you tell me the situation?

I figure if Rodolphe doesn't have any more, somebody will be
selling one sometime anyway. Hey, limited supply... sounds like
a good markup profit item. :-)

On Fri, 15 Oct 2004 16:51:51 -0400, Ronald J. Hall wrote:

Okay, replying to my own post, bad form and all that. :-)

Anyways - I've now got video, but I've still got problems.

I've got a small interface from Wizztronics that allows the use of 3.5" IDE hard drives. It plugs in where the cable that goes to a 2.5" drive normally goes. It has 2 power connectors coming off of it - one for a 3.5" HD and the other is for the Faloons floppy drive. If I use the original power cable from the Falcons MB, I get a blank screen. If I use the power cable from this interface board (to took to the CT60) it will boot up now.

Now.

The first few messages seem okay, I get a message saying that 256 megs of SDRAM is found, TOS is copied to it.

Next message:

keyboard error

Funny thing is though, I can bash any key to skip the memory test.

I have the Wizztronics 14 meg RAM board and SIMM from Best Electronics installed.

(I'm using the DEKA interface that I bought from Wizztronics - it plugs into the Falcons keyboard connector and allows the use of a PC (P/S2) style keyboard. It still uses the Falcons mouse and joysticks though)

and it goes on into the bootup process until it gets to where it would normally show the desktop. Then I get a screen like this:

EXCEPTION PROCESSING 2: Access Fault

Status Register (SR): $0300, bits to 1: 11 10
Program Counter (PC): $00000006
Basepage: $010CCE84
Cache Register (CACR): $A0808000
Address Fault: 00000006
Fault Status Word (FSLW): 01428020, bits to 1: R SZ1 TM1 10 RE
Supervisor Stack (SSP): $010D5FC0
User Stack (USP): $000E444E
D0: $01111558 A0: $01111570

this goes thru D7 and A6

Any help appreciated. Thanks!

5234. Modern Version of Starglider 2

Newsgroup: comp.sys.atari.st

One of my favorite games when I was a kid was Starglider 2, I loved the way you could fly to all the planets in the solar system and visit all the different planets and see their atmospheres. I was just watching the BBC documentary called "The Planets" I downloaded from www.supernova.org. And I was amazed by the computer graphics they used to show each planet and what their atmopheres looked like. It really made me want to play something like Starglider again but with updated graphics and utilizing our scientific knowledge of what thise planets are like. Is their anything like that out there?

I get a lot of them faults also, try a clean boot is all you can do, note that the falcons floppy power cable has to be plugged into the CT60 socket, CT60 powers the falcons MB via the floppy cable...

I'm still trying to work out my access faults, so far I feel my CT60 can't run at 66mhz, so im going to buy 50mhz soon to try that.... there also seems a lot of program I use which wont run at all under CT60 mode..... only thing ive managed to do is zip up files a lot faster, but even thats very unstable.

I have 256MB DIMM, along with a 14MB SIMM falcon card, no problems there... can't help you with your keyboard, probably a buggy check on the CT60, but if it works then dun worry ;-)

Nice.. So Deka doesn't work properly and neither does Qwertyx. Maybe users should be given choice in compiled ct60 tos whether or not they want the new keyboard stuff included. It'd sure make my life easier not having to disconnect my keyboard interface just to boot! I've actually given up and painstakingly repaired a MST keyboard to complete functionality.

Ok where to start. I'm not sure how ATX power works, but I'd venture to say the CT60 has some sort of internal circuitry which remains powered up and stores the powered state such that the CT60 may not realize the ATX supply is powered up. Yeah that does sound like bullshit doesn it?

Ok, regardless I'd probably rewire that PSU back to stock and convert that power switch to the CT60 power pins on the header. This will have future advantages (hopefully) anyway. Of course you need a push button switch.

Next we have the access faults. I can get these rarely. I find the CT60 runs a whole hell of a lot better while you're running NVDI. Try installing nvdi in tos mode and then boot in 060 mode see if it helps.

Unlike what exxos says, I'd sincerely hope that these 060's are burn tested a bit by Rodolphe, but with such a quantity maybe he hasn't had time to test them with anything but a simple powerup test. I know fpu's came untested on prior runs.

If you have any other DIMM's or ST-ram cards give them a shot, but I know realistically most falcon owners don't have 3 spares lying around ;)

Rodolphe sometimes communicates in spurts. His time is limited and I
heard he has some scheduling issues. Be patient, if he's not
responding to you then hopefully he's not responding to other people or
shipping out any CT60's from his secret stash ;-) I know in my case, I'd
rather him be working on VME to falcon bus adapter than answer emails ;-)
Maybe cracking away on a coldfire mobo design :-D

Thanks,
Mark

Well at least you have video now. Have you remembered to download the
CT60 archive and place in all current patches into the AUTO folder and
MAGIC folders if running MAGIC???

A friend of mine has one of these a 3.5 inch IDE hard drive adapters and
he has had the same issues as you have. But I simply bought myself a
2.5 inch notebook connector to a 3.5 inch regular IDE connector and I
have NO issues. I happened to have 2 of them and I sent one to my
friend now he has no issues. Wonder if this is coincidence??

Not GOOD! If you are running this DEKA connector there maybe issues
with that as well.

>
> Funny thing is though, I can bash any key to skip the memory test.

That still may function but you may lose control of it once you reach
the desktop. Not sure. Very rarely I get the same error but I also
HEAR repeated beeping through my 5.1 sound system. Probably a flaky
keyboard. Only happens once every 3 or 4 weeks.

>
> I have the Wizztronics 14 meg RAM board and SIMM from Best Electronics
> installed.

Does this have 4 4 meg simms on a pink colored "T"?? Agian this may not
be the best ST ram board especially if you plan on doing the 25 mhz DSP,
VIDEL and BUS speed increase!! I have a CENTEK board with 1 single 16
meg DIM and it works well. I have heard there is a guy that is making
some STRAM boards the RODOLPHE gave his blessing on. As far as your
CRUCIAL PC133 256 megs that should work great for the FASTRAM. I have a
KINGSTON 512 meg PC133 this also works VERY WELL. As long as the CT60
reports that it sees the ram if you go into the CT60 config and hit the
"I" in the lower right corner then hit SDRAM you will see if your CAS
latency is 2/3 which is acceptable. If it says just 3 consider yourself
lucky that it works. Cause only 2/3 or 2 will work on the CT60.

I used to get exception faults. But I would say it is an issue in your
auto folder. Not a power issue. If everything is turning on and
appears to be functioning. You need to leave everything plugged in
(including CT60) boot into 030 mode and check out your auto folder and
the order in which things boot up. If you do not have NVDI this would
help as well. If you do have NVDI you need a little program called
NVDI.prg that turns the CACHE off then back on. Then create a folder on
your ROOT directory of DRIVE C called NVDI and throw your old NVDI
program in that folder. What this program does is shut off CACHES then
loads the actual NVDI.PRG then turns the caches back on. What is in
your AUTO folder??? This may give a clue as to your problem. I had
major issues with what was in my folder and how it was arranged.
believe it or not I actually ran MORE stable at higher speeds. I found
at 72 mhz I rarely ever got access faults or fatal exception errors.
And since getting my CT60 and Falcon back from Rodolphe for my 25 mhz
system bus increase I have had NO issues what so ever. Do you have the
060 installed that runs at 60 mhz?? If so try a 72 mhz osc. you might
be surprised!!

Thanks,
Carey

Ahh one of my favorite games as a kid was Haleys Project you had to
navigate a spaceship through the solar system and land on different
planets. Amazing game for it's time. But that was on the 8-bit atari. For
the ST I would have to say Sundog is the greatest game of all time.

Unlikely to work with the CT60 as the power requirements are
different. Just get hold of a $3 2.5-3.5" converter off ebay or
wherever and push it onto the motherboard connector. You may need to
lift one end of the large capacitor that sits next to the IDE port and
stand it on end (I did). When using 3.5" IDE cables I found that
modern 80pin ATA cables were better than the standard 40pin cables for
a particular length. I still had to cut mine in half after the 1st
connector though to get a reliable cable. Use the shortest length
between the two connectors if you can. Then take a 3.5" power
connector from your ATX PSU to your 3.5" HD and you are done.
(I used a 10GB HD from my Xbox after I upgraded it to an 80gb (I
wanted to use the WinstonX ST emulator :-)). Because these drives were
sourced for their quiet operation, and low-ish power requirements they
are PERFECT for falcons (I have left my Falcon switched on overnight
and didnt realise because it was that quiet)).

I get this all the time. My keyboard still works. I use a TT keyboard
with a home made adapter. I dont pay any attention to this now, though
I would be interested in seeing the code that shows this error...

<SNIP>

> and it goes on into the bootup process until it gets to where it would
> normally show the desktop. Then I get a screen like this:
>
> EXCEPTION PROCESSING 2: Access Fault
>

Bus Error. Either an Auto prog or a desk accessory/CPX is crashing. If you dont use a boot manager, get one (I use Xboot III). Make an empty set/profile and add ONE item at a time until you find what crashes, then leave that item in the set on its own and test again. If its fine - add back other items one at a time until it crashes again then you will know if its the item itself or a combination of items. Try setting the TT-RAM flags on the offending item differently to see if it makes a difference.

Hope this gives you something to go with.

Coda.

> Any suggestions or ideas? Thanks much.

My CT60 would not stay on using the push-to-make switch on the CT60
jumper, it came on when pressed and went off when released. I built an
elaborate switch de-bouncer (1 cap and a resistor ;-) thinking it was
switch bounce, but it didnt work either. In the end I jumpered the ATX
plug itself (may have been pin 14 to ground IIRC) to keep the PSU on.
I use the power switch on the PSU to turn the whole thing on (Most ATX
supplies dont have mains power switches though)

Coda.

Hi!

Sometime ago a pin in the keyboard connector of my Falcon MOBO stopped to supply 5V. Since then i get this voltage from the ATX PSU (i have a ct060 installed). Now i would like to do it "cleaner" solding a wire from somewhere in the MOBO to the "back" of this pin. Which could be a safe place to solder this wire and get the 5V?

Thanks

David

May the gigabyte gods give you the solution.

A friend of mine is so fed up with Windows he threatens to go back to his Atari. Ah... the good ol days when a program was two or three files in a single folder.

I use it daily. I will send it back to you when I get my new 14MB card if
you still want it :) Thanks again for that! Which burn as far as which
TOS you mean? For me, any of them work, but the system won't boot up with
anything after 1.0 if they keyboard is connected.

Thanks,
Mark

I seem to recall someone mentioning a similar problem that turned out to
have been caused by a defective fuse, maybe you'd do better to find the
problem and fix it that work around it.

Try another PSU. I have this problem with one of my older ATX PSU's, but
my newer one works fine. The trick is to tap the switch as quick as
possible ;-)

DEKA not support all IKBD commands so you get the previous error.

> and it goes on into the bootup process until it gets to where it would
> normally show the desktop. Then I get a screen like this:

Try to start with the ALT key pressed, you must get the desktop without
driver or program started. If it's OK you can try again with the CTRL
key, in this case only the driver is started. If you get always crash,
maybe there are hardware problem :
- 060 overcking.

- clocks of motherboard.
- IDE cable too long.
- Reset line of the keyboard too long (I don't know if there are just TX/RX on DEKA interface like Eiffel).

Note that the latest boot display programs started inside the AUTO folder.

> this goes thru D7 and A6

What is the CPU frequency ? I remember than the last 060s of Rodolphe works _only_ at 50 MHz. The first problems with overclocking of the old 060 rev 1 is caches and FPU crashes. If the ALT key is pressed before the ATRAI logo, the machine start without cache (original features of the TOS 4.04).
If you try to increase the CPU frequency, crashs during boot can create data lost on you disk (bad FAT), because NVDI for example write on your disk during boot.

> Any help appreciated. Thanks!

Try to press 2 SHIFTS during the boot picture until you get the ATARI logo. In this case the TOS boot without SDRAM. If it's OK, check the SDRAM, with the RIGHT SHIFT pressed during the boot you can see infos about the SDRAM module.
If you have the latest boot you can use CTRL-ALT-SHIFT-SHIFT during the boot picture for get Atari Diagnostics tests. Warning ! Abnormal termination on RTC/NVRAM, IDE, SCSI tests may result in loast data.

Regards,

Didier.

New keyboard suff are just called if you press Eiffel key, at this state
it's just a keyboard test. An error message here has no importance, it's
just a warning. Nevertheless on the next boot version 1.02b (today not
inline), there are 4 old boot choices, and some new features like
Identify device, Compact Flash and removable drive boot, IDE slave, LBA
mode, keyboard test are bypassed.

I agree, however if you cant find the problem, you could take 5V from
the 6850 ACIA (Pin 12) thats close to the keyboard socket.

Coda.

You will need a 50-pin SCSI hard drive in an enclosure, plus an Atari
DMA to SCSI converter such as a Link '97 etc. Then a driver such as
Atari's AHDI (free), or HDDriver (commercial).

Plug the hardware up, set the SCSI ID to 0, make sure the disk is
teminated, fire it all up (drive first), run the driver prog from the
floppy, partition the hard drive and install the driver on it, job done.

As it stands, you could only use a hard drive connected to the DMA/ACSI port. For this you need to get an ACSI=>SCSI adapter (like the ICD link) a SCSI hard drive of your choice, and the necessary cables.

I would prefer to get a 2.5" laptop drive put inside the case. Barry at Keychange is hoping to make a run of IDEAL Hard drive interfaces, which work in STe's I believe. These go inside the case so you can have a self contained system.

Barry, can you enlighten him?

Coda.

Hi Ronald!

I came to think about something when I read about how you feed power
to your harddrive using that Wizztronics board. It's a while ago, but
I seem to remember that my CT60+falcon got a lot more stable when I
started feeding the harddrive and the floppy drive directly from the
ATX PSU. Earlier I had a split-up cable that fed both the motherboard
(from the CT60) and the harddrive.
So I would try to feed the harddrive from your PSU instead of the
Wizztronics board.

/Henrik

5269. "Notator.org" (website/Notator mailing list) up again!

Some of you might have noticed that the Notator website/mailing list (http://www.notator.org) has been down.

Well, it's now fully operational again, and new members are always welcome.

(the Notator mailing list is a place where people using the "Notator SL" and "Creator SL" MIDI sequencer/score software from C-Lab/Emagic can discuss usage og the program, share ideas etc. The website contains among other things a comprehensive FAQ, latest downloads and other things of interest to the Notator/Creator user -a MIDI sequencer fully usable today.)

I finally got the courage to take apart the st just to find the folowing stuff:
Some kinda of RTC card....The only thing that I can find on it is WEIDE - ELEKTRONIK???
It has a lithium battery thou:-)
There is two wires that are going out off her : One (black) is connected to a MC6850P , and the other (red) is not connected , but Im sure she was connected...the question is where?
The card is conected to the third rom chip (from the atari sign on the mobo)...
Also the revision of the mobo is C070243 REV H...What is that revision?
On the rom chip is labeled : RP23256 0161....What version of tos would that be? (I have no PS to see when I turn it on).
There is 16 chips of ram and an expansion connected to C025614-384 (only IC within the metal box on the mobo...) .It is ST-K5V4.0...
Please give some info

P.S. Is there some source on the net that I can find the answers to my questions (like www.amiga-hardware.com in the amiga community)?

P.S.S. Sorry for my bad english , Im in a hurry....

Thanks in advance

Hi!

The problem are the (L79, L81, L83)components that are close to the
keyboard connector.I think they are some kind of filters, i also think
that the L81 is the one which "died". I dont know if is possible to find
a replacement or what would be a better solution than getting the 5v
from anywhere else in the MOBO.

The only drive you can add wihtout having to buy any kind of adapter is an Atari dedicated drive, such as the Atari Megafile, but these were only small capacity drives, 20,30 or 60mb. Supra and SyQuest also made drives that could be connected directly to the Atari through it's propreitry hard drive port on the back of the machine. They can still be found second hand, though I dont think many above 80mb capacity were made.

However it's farily easy to get adapters to allow it to take SCSI-1 drives, ICD made several which went by the name "Link" and "Link97". The latter was a simple plug in and go device, the other versions were internal. They are not made anymore but shouldn't be too difficult to find 2nd hand as they were quite popular.

There are few adapters as well allowing you to connect IDE drives, inlcuding one that connects though the catridge port whihc I think was made by a company called Paksud, and I think is still being made.

I think the largest drive you can run on an ST is 2gb capacity.

Source record: 16674

Okay, things seem to be much better. I downloaded the CT60 archive from Didiers' web site and used it.

The biggest single culprit seems to be that the version of Xcontrol that I was using caused everything to hang up. I used the updated version and I can get to a desktop now.

I still get the keyboard error on bootup. The on/off switch now starts and stops the ATX power supply, and the CT60 with it.

The CDwriter (Plextor 12/4/32) seems to be working fine with ExtenDos.

I'm getting an odd, random data error with the floppy drive and new floppies - just every now and then. I'd be tempted to say that this is a separate problem and not related to the CT60.

I've got some more questions <smile>:

According to the CT60 CPX, my temp is running at about 40c. Is this acceptable?

I'm using NVDI v4.12, and HDDriver v7.61. Is that okay? Or do I really need to find a way to upgrade to newer versions?

I'm a little confused on how to set the CT60 to '030 mode using a switch. Its the 3rd and 4th pin in the back row, right? Should it be a true on/off switch or a momentary switch? Does this need to reboot or is the effect immediate? BTW, what does the jumper that says F30 boost on the side do, and what position should it be in?

Thanks gang! :-)

Hi all,

Recently we learned that Odd Skancke (aka Ozk), one of the most outstanding FreeMiNT developers, has met with some bad luck recently: His trusty old Hades has given in and hence his possibilities to continue with his FreeMiNT/XaAES contributions has severely decreased.

While it may be possible to fix the Hades board, Ozk has explained that his current financial situation definitely prevents him from doing it. This is where we can make a difference! On the unofficial XaAES page I setup a repair fund page, where you can read more. Please have a look, this might be your chance to give something back to the FreeMiNT community!

Hi there

Just this morning, I was staring lovingly at my old pile of ST's and started thinking that it would be great if someone could invent some sort of adapter that would plug into the DMA (hard disk) port and allow the ST to use flash memory cards. It would have to plug into the back of the ST, no messing with internals.
Is it possible, would it be affordable ?

What do you think ?

There is a patch for xcontrol in the CT60 software package.

>
> I still get the keyboard error on bootup. The on/off switch now starts and

Good. Forget the keyb error, its inconsequential.

> The CDwriter (Plextor 12/4/32) seems to be working fine with ExtenDos.

Cool.

> I'm getting an odd, random data error with the floppy drive and new

You have plugged the Floppy power cable from the motherboard into the
CT60, and powered the floppy drive from the ATX supply I assume. Its
possible that your drive is on its way out, or just dirty from years
not being used accumulating dust. Try a wet type head cleaning disk.

> I've got some more questions <smile>:

:-)

> According to the CT60 CPX, my temp is running at about 40c. Is this

Yep. Mine is 46c at 66mhz.

> I'm using NVDI v4.12, and HDDriver v7.61. Is that okay? Or do I really
> need to find a way to upgrade to newer versions?

I guess so. NVDI 5 has more printer drivers but I dont know if theres
any other significant improvements. I have V2.5 upgraded to V3, and I
have tried V5 but there isnt a huge leap from V3 to V5. I read that
some CT60 people had problems with HDDriver 8.01 copying files >64K.
Cant remember why, or even if it was fixed. Maybe Dr Uwe will answer
this for you.

> I'm a little confused on how to set the CT60 to '030 mode using a switch.
> Its the 3rd and 4th pin in the back row, right? Should it be a true on/off
> switch or a momentary switch? Does this need to reboot or is the effect
> immediate? BTW, what does the jumper that says F30 boost on the side do,
> and what position should it be in?

On/Off switch. In my case going from 060 => 030 reboots anyway into
030 mode, but from 030 => 060 the system hangs, and I have to press
reset.
The F030 boost jumper turns on the falcon motherboard overclocking. If
you have a "with solders" installation that is. It rasies the bus
speed from 16 to 25 mhz (newer CT60s have a 50mhz clock on board for
this purpose (25mhz bus)), and also the Videl and DSP get a new clock.
Unless you have a "great" Ram card (a good 72pin simm model and a good
72pin simm) the screen will be covered with artifacts if you boot with
25mhz bus. Try it and see.

> Thanks gang! :-)

Coda.

Yes those are just filters. It wont be easy to find a replacement
unless you have another ST mobo lying around to take parts off. I
personally would bypass it.

Coda.

Umm, there's a manual? Is this something thats only available online,
because I didn't get a printed out manual in my package.

Thanks.

Hi Sam,

S>Can one boot from the HDDriver floppy?
if there's an AUTO folder on the floppy's root, and if HDDRIVER.PRG inside this folder: YES!

But I suggest to run (not necessary to boot) HDDRIVER.PRG from the floppy, then run HDDRUTIL to get your proper installation, save it and finally reboot!

Those filters have 3 "legs" so i dont really know how to bypass them,
also i can not see the track which is going to the +5V pin in the
keyboard connector. Are there Falcon schematics somewhere in the net? i
didnt find any.

Anyway i think i'm going to leave it like is now, at least it works. Playing to be Rodolphe this last two days i saw smoke coming from the Falcon MOBO twice :-).
Enough for my heart.

Thanks both of you for your help

David

Oh yeah, and bootup with no hd-driver disk and test out some other disks.
maybe your drive is hooked up wrong or broken. I tested out the FDD and
it worked perfectly for me. But i was under TOS with NVDI so I know at
very least it'll work with NVDI.

Mark,

It's not the fdd. What I mean is that, the HDDriver floppy will boot but, when it gets to Uwe Seimet's copyright line, everything following that line is yakked up on the screen, and the disk is still continues to boot when you hit the space bar.

As far as I can tell, the other programs on that disk launch and work fine, except for HDDriver.prg.

I sent an email to Atari Workshop, hopefully they will have a solution.

Thanks!!!

When I had MINT installed before, on my Nemesis equipped Falcon, I thought it was a blast. In fact, MINT was actually what got me started on Mandrake Linux. It only seems right somehow that I have come full-circle. :-)

I'm trying to remember what it was called that I used? KGMD? Or something like that. Can't remember honestly. It started from a floppy though. I used docs by K.Ellis (Karen?). Whatever became of her? At one time she was a very strong MINT/Atari advocate.

Well, it would be a combination ASCI -> SCSI -> IDE -> CF adapter.
Every piece already exists, so it is definitely possible. As for
affordable, although the pieces required probably wouldn't run over
$200US, taking the time to design it would probably have to be a labor
of love.

Barrie at Keychange is thinking of creating an internal IDE -> CF
board. I'd email him regarding your interest.

Grumble. Try turning off the F030 boost. Switch the jumper to the other
position to get back to 16MHz bus mode. I have screen display issues
without nvdi and this could be it. I have my doubts that hddriver is to
blame.

Thanks,
Mark

The added steps are silly IMHO. The internal IDE adapter is the way to
go. Sorry ease of use, cost and sanity must prevail. Then from IDE to CF
is a simple matter of a store bought adapter which is nothing but wires.

Well that's a tough one. Try using AHDI to get an HDD running to begin
with, then copy nvdi to it, and boot, THEN try running hddriver,
installing hddriver to disk, then reboot again with hddriver and nvdi?

I dunno.. hd-driver 8.1 worked fine for me when I used it on your falcon.

well this might be silly but do you have video set in medium
resolution? I noticed when i used it in low res it was really hard to
use (the menus overlapped ect) I use hddriver 8.1 and it was easy to
use once i had my screen set correctly

Actually, I have been wondering about such a device myself for quite some time now. For my Commodore 64 I just ordered an IDE/CF card (ide64) !! Just makes me think that using some other i/o port could be feasible. Maybe even the ROM port or VME bus (MegaSTE/TT)!

The problem is that I would not know how to design this. The guys here who actually CAN are very busy in other projects. I try to sustain as many projects as my wallet can survive. I would be a fan of an external kind of adapter for my MegaSTE.

If the Commodore 64 can do it...

High regards,
Renï¿½

Solder wire between the two outer pins of these filters. Middle pin
on the motherboard connects to ground.

I've never experienced problems bypassing them.

Booting HDDRIVER from a floppy should work fine, and up to now I haven't
got any reports that tell otherwise. My guess is that your CT060 somehow
influences the boot process.
Maybe other users can check this with their machine, in order to shed
some light on this issue.

Possibly, but a big use for CF cards could be in trasnferring images
to/from a Digital Camera or mobile phone, for which having external
"plug n go" access would be a huge advantage.

Okay Uwe, here is exactly what happens:

I boot from the HDDriver floppy, Falcon boots normally, HDDriver starts to boot, but when it gets to the copyright line, that line then gets screwy, and all the following text turns into a mess with outlined arrows pointing up.

If I boot from floppy without running HDDriver.prg , then the screen display of the boot process is fine. I can even run the hddriver utility program. It seems to me to be something with HDDriver.prg, but I don't know what it could be, or if HDDriver.prg is even at fault.

I'm just in the process of putting some stuff on the web I've had lying
around for ages. The first is a Computer Field Service Manual for the
520/1040 STe
I haven't seen this online before, maybe someone can make use of it ......

Cheers

When using v7.61 here, I did have a window open up and telling me that
this app had problems with the cache, and gave me options to ignore, not
use the cache, etc,...I clicked don't use the cache and it worked fine
after that.

Don't know if the same would apply with newer versions though.

Yeah, that happens when the hd utilitiy progam is launched.

I can do all that. I am thinking that if a use a windows machine to re-partition the drive to one large partition, then maybe HDDriver .prg will launch normally.....I don't know. Maybe I should use AHDI first, then go with HDDriver.

This sounds a like a crash to me, with the bombs not being recognizable
as such because they are messed up with somehow. I have seen many
crashed of this kind (not with HDDRIVER, but in general) in the past

> If I boot from floppy without running HDDriver.prg , then the screen display of
> the boot process is fine. I can even run the hddriver utility program. It seems
> to me to be something with HDDriver.prg, but I don't know what it could be, or
> if HDDriver.prg is even at fault.

I'm afraid that as long as booting HDDRIVER from floppy works fine on
other machines I have to assume that your hardware is causing these
problems. HDDRIVER does not do anything special with the screen, it just
lets the OS print anything. There is no alternative anyway because
anything related to the GUI (AES etc.) has not yet been initialized when
booting the AUTO folder.

>
> I've never experienced problems bypassing them.

Hi!

If you mean the outer pins of the filter that i think is dead, this
didn't work, i didn't get the 5 V from the keyboard connector pin. Other thing
is that you mean soldering a wire from the outer pin from L79 to the
outer pin of L83, i didn't try this because i don't know how are these
filters connected eachother.Do you mean this second way?

To check which filter was failing i tested continuity with a
multimeter, then i got that L81 didn't have continuity between one of
his outer pins and the pin in the middle, while the other two filter
have it.

Thanks

David

No it wasn't my cigarette, the first time it was from a trace on the MOBO back. I was pressing
the plastic keyboard plug into the MOBO connector, and i started to see
smoke coming from the MOBO, after that no more sound was coming from my Falcon, i
was thinking in my Falcon doing a trip to France when i saw the burned
track on the back. Fortunately after i fixed that trace the sound came
back. Not happy with that experience i did some more "experiments" without
succes, then i gave up and turned my falcon on without wires trying
to bypass anything, but surprise..... i could see smoke coming from
one resistor close to the codec. Also nothing important but like i said
too much for my hearth.

Just to clarify, the IDEal interface is already in use, a proven product.
The CF card adaptor is a straight fit in the cable and the units tested work
with AHDI 6.06, straight out of the box.

My origional post was to see if the market still existed for another
production run of the IDEal interface, current enquiries total ....3...

We need 30 paid orders to go ahead.

Hello Sam,

I think you might first configure HD-Driver correctly (use a backup of
your HD-Driver software, and don't write-protect it) :
1- boot from a diskette with no Hard-Disk driver,
2- insert your HDDRIVER floppy and run HDDRUTIL.APP, then at the prompt
locate the HDDRIVER.PRG (normally : A:\AUTO\HDDRIVER.PRG),
3- go to the TOOLS menu and select DEVICE CHECK to check that your devices
are correctly detected,
4- select AUTOCONFIGURE, so as to let the app turn the devices on,
5- check the parameters in SETTINGS/MISCELLANEOUS : the first 3 boxes
may be checked, 4th (Background-transfer) *must* stay unchecked!
6- in SETTINGS/BOOTPARAMETERS, check that the OS is set accordingly,
that SCSI-ID is set to 7 and checked, and that
BOOT-DEVICE-I-DON'T-KNOW-WHAT remains unchecked,
7- exit HDDRUTIL and reboot straight from this disk... it now should
work fine :-)

Have you tried booting the Falcon and then starting HDDRIVER.PRG from
the desktop? What happens when you do? If HDDRIVER.PRG makes a mess of
the screen when starting it from the desktop, it looks as if the file
has been corrupted somehow.

>It seems
>to me to be something with HDDriver.prg, but I don't know what it could be, or
>if HDDriver.prg is even at fault.

Do you have a backup of HDDRIVER.PRG somewhere? If you have, have you
tried copying that backup to a floppy and trying to use that instead?

As a method of almost last resort, if you don't have a backup, you may
be able to retrieve a fresh copy of the HDDRIVER.PRG from inside the
HDDRUTIL.APP. I have version 8.13, dated 2003-08-02, and with a file
size of 248010 bytes. Within this program there is an embedded copy of
HDDRIVER.PRG. This embedded copy starts at byte 213476, ends at byte
241387 and has a size of 27912 bytes. It should be possible to "extract"
this using QED or any other binary file editor.

Regards,
David Bolt

Even a non-configured HDDRIVER is not supposed to crash when being
booted from the AUTO folder. If the configuration is wrong it will
simply report an error or not find any devices or partitions, that's all.

I don't recommend this at all. The installation instructions of HDDRIVER
are clear and do not require messing up with files like this.
By the way, I cannot find you in my database of registered users. Can
you please send me your HDDRIVER's serial number, so that I can register
you? Thank you.

I'm 99% sure that all three filters have the wiring as follows:

Pin 1 : 5v
Pin 2 : GND 0v
Pin 3 : 5v

I've seen filters that have no continuity between pin 1 and pin 3
which is bad. You shouldn't have any continuity (less than 10ohms)
between pin 2 and pin 1 or 3.

Note, I now have a PHOTO of this stand from an ad in 1986 Antic
magazine:

http://www.blakespot.com/images/STation.gif

Still on the search - please let me know if you can help me source one
of these stands. Thanks.

Thanks Jean-Luc,

Now my HDDriver works!!!!
Question, the only work hdd I have at the moment is a 30gig hdd, What is the best way to partition it? I don't want a bunch of partitions. Also, when the hdd is ready, I will be installing Magic5 as the OS.

Thanks,

With MagiC you can use FAT32 filesystems, which will exclusively be
available with MagiC or MiNT, and have virtually no size restriction. So
creating some of these partitions (see the HDDRIVER manual for details)
is most likely what you should do.

Hardware can be an issue but perhaps not as much as I originally thought.
For years I struggled to read non-standard floppies under NT (then W2K) but
under debian (same machine) 'fdmount' figured it out automatically. I had
assumed the chip or drive was naff. Apparently not!

Fwiw, another machine with a cheapo ï¿½3.50 drive also worked. In both cases
I'm talking about reading only - I've no reason to attempt a write.

Okay, since it's clear Rodolphe doesn't have any left and I missed
my opportunity, I'll try it this way.

Anyone got a CT60 they've decided they don't want? I'd really like
to get ahold of one. If you've got one you've decided you don't
want to install and you'd like to make a (reasonable) profit on it,
let me know.

Can't say I'm not trying... :-)

Okay, I've just bought and received N.aes v2.0 from Woller Systems. I've got a 3 HD floppy disk, and one CDROM.

There are *no* printed manuals in the case.

Can someone point me to a good FAQ, or HOWTO? Or fill me in? :-)

A few question pop immediatly to mind...do you install easymint first, then N.aes or vice-versa?

Perhaps there are english docs on the CD? (I've even looked at it yet - I will).

Thanks.

5347. Sound problems (Falcon)

Newsgroup: comp.sys.atari.st
Date: 2004-10-21 21:06:51 UTC
From: "Ronald J. Hall" <darklord@darkforce.ky.org>
Message-ID: <pan.2004.10.21.21.06.50.614052@darkforce.ky.org>
Source record: 16641

Well, I've suddenly lost all sound with my Falcon. I plugged the speaker setup into my Linux box, and its working fine.

I've got no keyboard clicks, no sound from MODs (Bobtracker), or from any games.

I did have sound working fine before. The only thing I've added in the last couple of weeks is the CT60. I don't think thats the problem but its the only hardware mod that I've done. I had not played anything with sound under the CT60. This is the first time.

Any ideas where to start?

Thanks.

A rather quiet Falcon owner...

Following up:

Well, I pulled the CT60 and I got all sound back. Anyone have any ideas
about this?

I'm in the middle of glueing the heatsink to the CPU and once it dries,
I'll re-install the CT60 and see if I lose sound again.

Thanks.

5349. Re: Sound problems (Falcon)

I also have sound problems, but they occurred before the CT60. Of course,
after the addition of the CT60, I get a blank white screen more often then not,
and no activity from my drives.

In other words, I feel your pain.

An uninspiring blank Falcon.

There is a week ground track on the audio plugs on the falcon, it could be
blown, though I dont know about this relating to your CT60 problems.....

Hmm, don't think its that. I hooked the CT60 back up, and lost all sound
again. It works with the CT60 removed.

For some odd reason, the CT60 kills all sound on my Falcon.

Anyone have a similar expericence, or any ideas?

Thanks.

My suggestion was as an almost last resort solution, if no backup copy
was available. The last resort, of course, being to send the disc back
to the supplier for them to replace it.

However, as the OP seems to have solved the problem, they don't need to
use this suggestion.

>By the way, I cannot find you in my database of registered users.

Strange. I would have thought System Solutions would have passed on the
details.

>Can you please send me your HDDRIVER's serial number, so that I can
>register you? Thank you.

Done.

I had problems with the CD. To make it work took the oldest CD drive I
have, a NEC 1x, and the newest drivers, Extendos Gold, or Platinum, or
whatever its is.

If it seems to not work correctly, it is probably OK, just fussy about
what reads it.

If I recall correctly, which is a good possibility, one just clicks on the
install program, and waits a while.

n.aes comes first. Easymint will ask you where the binary for the version
for your machine, automatically loaded, is, so that it can write a
suitable configuration file.

Jim

Selling cheap because I know how expensive it can be to get the stuff to get this thing working. I'm hoping to replace it with a 1040 STE at some point.

I'm pretty sure it's working, because there's no apparent damage and it worked quite well before I moved and the power supply started rattling in it's case.

I'll be selling some more atari stuff soon, including a copy of PC Ditto, a large archive of STart magazine, as well as demo disks from STart and ST Format. Also going to be putting up a functional Amiga 1000 with keyboard and mouse (No kickstart disk. Otherwise I'd be holding on to it).

Hmm, I've got a Plextor 12/4/32, usually reads most stuff I throw at it,
so hopefully it will be fine.

I did notice that the CD is one of those thats not labeled - both sides
almost look identical.

Okay, I just tried this a few minutes ago. I'm having some problems. First of all, the CD read fine in my Plextor CDRW, no problems there.

The menus are all in German, no surprize there, but I'm not very literate in that language so I guessed my way through it (and I'm sure thats where the problem lies).

Anyways, I picked Falcon/68030 for the install. I didn't change any default paths (c:\multitos and naes for example). Should I have picked the Milan since it has an '060 in it, like my CT60?

The install itself seemed to go smoothly, but when I rebooted, it goes to a black screen then does endless rebooting, time after time.

I tried 030 and CT60 mode, made no difference, AFAICT.

Any ideas anyone? Thanks!

Maybe. There are some ECL monitors around for the Sparcs, but if you
look at the specs, most of them have hugely different H+V frequencies.

Coda.

Maybe. Are you trying to run NAES, but have not yet installed MiNT? If
so then thats your problem. NAES will not run under TOS. Once
installed, disable it, then install the Easymint. I personally would
have installed Easymint first, but then you have to configure NAES by
hand afterwards which is a pain.

Coda.

Hi Coda. Thanks for the reply.

Okay, the last message from the installation, I believe tells you that its done and asks whether to continue or reboot for the changes to take effect (please feel free to correct my sorry attempts at interpretation!). This would be the time, I'm assuming, to disable *before* rebooting that first time, right? :-)

Whats the best way to do that? It adds stuff literally all over the C drive, an AUTO folder program, Multitos, Naes, and several ACCs.

Thanks much!

A lot of people were/are fed up of the flame wars, general abuse and spam that gets posted to a lot of newsgroups and have changed to moderated web forums like Atari Age (www.atariage.com) where anyone posting such rubbish will have their account closed, I guess this is what has happened.
For the most part the flamers, spammers and trolls can't be bothered to keep setting up accounts as so it a much nicer environment be in.

On a seperate note could you E-Mail me privately as I want to talk to you about your TOS 2.06 guide.

Uwe,

What is your stance on people that have HDDriver that was with their
Falcon when they bought it, and lets say for example they lost the
original floppy, but still have HDDriver installed on their falcon,
and maybe a copy on floppy. Does the HDDriver belong to the user as it
was in the purchase of the falcon, or are they not entitled at all to
use it?

I have this friend....

Coda.

Copies are only legal if the user is either registered with me or she/he
has the original floppy disk with the serial number on it, so that the
user can register this serial number any time he wants to.
For any other copy there is no way to prove that it is legal. In
particular copies on hard disk drives or floppy are suspicious.

It's obvious that illegal copies are especially hurting small platforms
like the Atari.

Well, I e-mailed Rodolphe (hated to bother him but) and he gave me the answer spot on. (he also said that this had been dicussed in this newsgroup, I guess I just missed it).

The original floppy drive power cable that comes from the Falcons MB and connects to the floppy connector on the CT60 must receive 12v. If it doesn't then the sound circuit on the Falcon won't work.

I checked my cable, lo and behold, it had a very loose connection on one wire. I stripped it, re-soldered it, plugged it back in to the CT60, and voila! instant sound.

Thanks to everyone who replied. :-)

I use version 8.11 and it works great for me on my Hadea and my
STe. I also boot from a floppy when I needed to adjust some files
on the boot partition. Actually, to do that you can also just boot
up the ATari computer and get a plain desktop, then run the
HDdriver program and you will have access to the hard drive.

You need to run the HDDriver ultility program and create a SYS
file that will go on your boot partition. Then just reset the
computer and everything should come up.

Message-ID: <20041022195237.10984.00002199@mb-m14.aol.com>
Source record: 16577

Hello All,

Let me start by saying that once in awhile, my Falcon will actually boot, and then allow rebooting a few times. However, much more often than not, I just get a white, blank, screen.

Okay, my problem. I start my Falcon, the Falcon and CT60 both get power, but my fdd does not get checked (no light), and the hdd does not spin up. All I get on the monitor is a white, blank, screen.
Even if I re-boot, completely power down then power up the Falcon/CT60...nada, zip, nothing, but a white, blank, screen.

As I noted earlier, once in a awhile, everything works. Falcon/CT60 boot, the on-screen display of the CT60 info, memory count, hdd check....oh!!! What a beatiful sight!!!! Then, if I am lucky, I can reboot and see all that again!!!!!
But more often then not, I'll reboot and get a white, blank,screen.

And what's really frustrating, I can't even get the hdd prepped because I can't reboot!!
All I get is a white, blank, screen.

I know I could send it to Rodolphe and more than likely he will be able to fix it but, given the cost of the shipping alone (I live in the U.S.A.), not to mention the distance of the round trip for Falcon mb/CT60, I have decided to leave that as the ultimate last resort.

So, I hope between all of you, you will recognize what is causing the problem, and know what the fix is.

Thanks to each and every one of you!!!

This is not worth arguing about, but for me, N.aes installed under TOS. Of course, it did not run under TOS. And yes, it does add stuff all over the C Drive. Or, I am wrong.

Disable? Do you have a boot manager, such as Superboot? Boot into single tos. EasyMiNT starts under TOS, or can start under TOS, and installs MiNT.

Maybe a TT works differently, but I doubt it.

Jim

Hi Sam
Well the only thing I have seen that simular to that is my TT,
sometimes the memory expanson works its way loose and I get the white
screen.. once I press it back it boots ok so maybe something isn't
seated all the way and it shorts..gonna fix that soon tho (got me a

hot glue gun) I wish you luck on the Falcon :)

Sam, can you fill in a few details for us? You are using an ATX power supply right? What memory board are you using (original), etc?

If I was in your position, I'd check a couple of things:

1. Is the power supply a known good one? If in doubt, I'd try another one.
2. Is the floppy power cable from the Falcons MB firmly connected to the CT60 - noting the red/blue wire position?
3. Are you using the ATX power supply to power the floppy drive, the hard drive, and CDROM if you have one? If not, I would.
4. Is the CT60 itself firmly and correctly plugged into the Falcons expansion bus?
5. Is it possible that you need the 4.7 capacitor attached to the existing capacitor? The one right behind the reset switch on the Falcons MB? I had to put one there. Rodolphe mentions it on his website, and Wizztronics included the capacitor with their Falcon Rack, if you have one of their kits (if I remember correctly, you did buy one, right?)
6. RAM. Make sure your RAM card is firmly and correctly seated into the memory slot on the CT60. Also, make sure you're using a single SIMM memory board for the Falcons original memory expansion, and that everything is firmly/correctly seated their as well.

I hope this helps, and you get everything going soon! :-)

Sam,

Im assuming that the HDD is a 3.5" drive, which you have powered from
the ATX supply. 2 things.

1. What type of IDE cable are you using (40/80pin), and how long is it? Do you have another you can try? (Try cutting a spare one in half so you have a short length with a connector at each end).
2. Can you get a multimeter, and test the 12v off the ATX supply?

I think that the garbage you are seeing with HDDriver is when it doesnt detect the IDE drive properly and you get loads of wierd "~~~~~~~~~~" when it should say "IDE0: IBM-20040 HUGE MOTHER" or whatever. The IDE in the falcon is flaky to say the least (its not buffered at all) so although some people can use 2' IDE cables most of us have to use short ones (mine didnt work with a standard cable, I had to cut it down).

As for your white screen problem, like I said check the 12v, and also have a look at the solder jumpers on the motherboard. They tell the system what speed ROMS are fitted. They need to be a particular way for the CT60.

Coda.

Well the Accs wont bother you, I cant remember if NAES puts anything
in the auto folder (maybe NDIALOG?). IIRC the way the falcon starts
its GEM it looks in the gemsys folder (from the assign.sys) for the
new gem.sys is which is for multitos, the NAES is named N_AES030.sys
it may be in the /N_AES folder. Just start renaming the last letter of
the file to 'x', example: N_AES030.SYX. This will prevent the file
being found and normal gem will start up.

Im afraid I cant remember more, its been a while since I played with
NAES, however, if your still stuck then email me, and I will install
it on the TT and see what the deal is.

Coda.

ATX PSU power up problem
Check to add a 47 uF capacitor on C7 to increase power up sequence ..

????? Don't care here with slow bus at 16 MHz !

and how long is
> it? Do you have another you can try? (Try cutting a spare one in half
> so you have a short length with a connector at each end).

Don't care with 16 MHz bus !
Or the HDD is very old and had too slow timings (PIO 0 or 1 maybe).

The timing of ROM don't care at 16 MHz bus !

AGAIN, a 16 MHz bus with CT60 is like a 16 MHz bus with nothing on the exp
connector !
CT60 follow the Falcon timings and 68030 cycles !

The only timing problem is the 74F04 or 08 that can add a delay that may
de-synchronize the ABE chip of the CT60 with the F30 bus !

3 are ready for you !

Why ? : some bad people reserve and when I go back to them to ask money to confirm, they don't answer me after several emails !!
Bad guys on atari !

PS : 50 MHz clocked boards ! The 060 is not accepting 66 MHz !

Same remark with CTEX !
I get 40 reservations and now only 28 were payed !
The others are from bad people that never cancelled !
A such attitude is very dangerous for me ! Happy that I did not order the production of 40 CTEX !!

CTEX producttion will be order monday ! 28 exactly.

If you are new here (?) you get time up to monday morning (Europe time) to pay one.

Regards

Too bad that a few people have to mess up for the greater mass of
serious people.
So does this mean that "comp.sys.atari.st" has changed to include
hardware related stuff as well?

> On a seperate note could you E-Mail me privately as I want to talk to
> you about your TOS 2.06 guide.

I'd forgotten all about that (been travelling for almost a year), but as
I remember it I'm done with that project.
Are you saying there are some loose ends?

I put in an awful lot of work in that stuff, and I'm not really keen on
restarting it all if you know what I mean.

What language would you like that in? There are several in the book.

It lists deflection angle, phosphor tupe, active display area, rise and
fall times, blanking rate and frequency.

Assuming that what you are asking for is frequency data, it is 71.9 kHz
horizontal, and 71.6 Hz vertical.

If dim memory counts, the Montiterm and the TTM-195 were interchangeable.
I know that a Moniterm adapter board was made for Mega Machines, and
worked better if wired directly into the power supply.

Andy Ball <null@not.valid> writes:

Neither of these are the problems. I used several ATX PSU's to try to get the problem to go away. I also used my working configuration of IDE cabling/adapters/drives on his falcon and it didn't help. I REALLY tried to troubleshoot this. It does it in 060 mode and 030 mode.

It's right. I did the with solders installation adn the solder jumpers look good. He has the faster tos rom.

Thanks,
mark

His falcon does this boosted or not. 74F04 is gone and resistors are
installed. ABE5L as came from the factory (you ;-)). His falcon does
this with my CT60 on it. This is a problem with his falcon motherboard.

Thanks,
Mark

He has a wizztronics which I am sure is working perfectly.

> If I was in your position, I'd check a couple of things:
>
> 1. Is the power supply a known good one? If in doubt, I'd try another one.

Tried 3 not counting his ATX psu too.

> 2. Is the floppy power cable from the Falcons MB firmly connected to the
> CT60 - noting the red/blue wire position?

This only causes no sound. System would still boot. His white screen
issue is more like DSP is crashing. I think this problem could be related
to his audio crackling in the right channel.

3. Are you using the ATX power
> supply to power the floppy drive, the hard drive, and CDROM if you have
> one? If not, I would.

Sam this is important. Make sure you're following those instructions.

4. Is the CT60 itself firmly and correctly plugged
> into the Falcons expansion bus?

Definitely.

> 5. Is it possible that you need the 4.7 capacitor attached to the
> existing capacitor? The one right behind the reset switch on the Falcons
> MB? I had to put one there. Rodolphe mentions it on his website, and
> Wizztronics included the capacitor with their Falcon Rack, if you have
> one of their kits (if I remember correctly, you did buy one, right?) 6.
> RAM.

Mmmmm.. I have to call no on this. When that capacitor needs installed
the problem is a black screen. I have this problem with my falcon and it
only happens sometimes. His falcon displays CT60 boot logo and THEN a
white screen.

Make sure your RAM card is firmly and correctly seated into the
> memory slot on the CT60. Also, make sure you're using a single SIMM

> memory board for the Falcons original memory expansion, and that
> everything is firmly/correctly seated their as well.
>

He's got a wizztronics and it's installed right.

When you guys think about this. Think about defective hardware or component or broken trace on the MB itself. CT60 + accessories like PSU and floppydisk are fine.

His note is also important. When it shows the white screen instead of atari logo, his hdd won't spin up, no floppy access etc. Kind of strange.

Thanks,
Mark

Well this is best thing I've seen yet. But I was getting this issue with my Atari 4mb or my 14 meg card too on his falcon. I subbed all parts out. Again this must be a problem with a component on his falcon mb. Anything easily removable WAS and was swapped with known good parts to test. None of that stuff is broken.

Source record: 16500

Hi, I was looking for informations about new Wacom tablets on the web, when I suddendly found a page talking about how to use a serial Wacom tablet on Amiga.

So I've done a search for Atari driver, and they exist:

http://www.wacom-europe.com/uk/downloads/driver/driver.asp
=> ftp://ftp.wacom-europe.com/pub/Others/ATARI.ZIP

Unfortunately, if there is a "liesmich.txt" and a "readme.txt", they are both written in German :(

Could someone that knows german tell me if this driver would allow me to use my good old Pen Partner (serial connection) on my MegaSTE, and use it under gem programs like Degas Elite ?

Thanks in advance !

Dbug

My old roomate Noah Silva wrote a wacom driver once before. I'll try to
dig up the sources to it. I think he wrote it in pure pascal. He had a
serial artpad I think.

Thanks,
Mark

The ATARI ST is EVIL, it's the work of the devil, made to collect your souls and to turn you into brainless slaves of hell.

If you like the ATARI ST, you will lose your soul to be damned for eternal torment in hell.Demons and devils will feast on your soul for all eternity.

So stop using this evil system now to save your soul.

Or the holy inquisition will come for you and burn your flesh to save your soul, because the devil must not collect more souls or nobody can prevent Armageddon.

The ATARI ST is evil, using an ATARI ST is BLASPHEMY , only heretics and witches like the ATARI ST.And heretics and witches shall BURN !

ATARI ST = hellish computer manufactured in Hell's Kitchen by Satan !

There are only two ways to explain a WHITe screen without atari black logo !
:
- Blitter problem : check the arbitration signals and the jumper on falcon
bus when no CT60.
- DSP is crashed ! : check what you did on the DSP clock of the DSP !

No other way I know for white screen during TOS 4 boot !

AFAIK, there are/were at least 500 of them in the entire world. In the
UK alone I personaly know three Hades owners. There are probably more in
the UK.

Lineout releases CT60 VLM System October 10, 2004

Earx of Lineout has released a new Virtual Light Machine system for
the CT60 (or other powerful accelerators) today. The VLM comes with a
miniwhip-style coding inviornment for coders who wants to use the background
engine.
Earx writes:
A preview of the forthcoming virtual light machine, primarily intended
for ct60, is released. It can play some plugins from the famous whip!
Program, but it can also run new style plugins. A few of these are supplied.
Have fun!
Download CT60 VLM from Lineout

ACE Midi v1.10 released October 7, 2004

Nemo writes:
ACE Midi Version 1.10 Released
Thomas of Newbeat has released a new version of ACE Midi. Here's the
overview of fixes and features for this version:

a.. Update: Mono/Poly-mode was implemented.
b.. Update: Portamento was implemented.
c.. Update: The sound engine was improved to work better with
accelerators (for example AB40 and CT60).
d.. Update: All interface graphics were converted to loose IFF
files.
e.. Update: Interface graphics were updated.
f.. Update: Mouse acceleration and screen saver settings were moved
to the MASTER section and are now saved in the master configuration file.
g.. Update: A small window displaying the names of the currently
loaded samples was implemented.
h.. Update: The oscillator OFFSET parameter is now enabled in all
mix modes.
i.. Update: A small indicator was implemented in the MASTER section,
displaying current number of voices in use.
j.. Update: Parts of the final volume calculations were moved from
CPU to DSP to improve accuracy.
k.. Update: The filter tables were optimized to take less space in
memory.
l.. Update: Maximum number of voices possible increased to 20.
m.. Bug fixed: Effects settings in the MASTER section was not always
updated as they should have.

The new version was sent out to registered users via e-mail. Otherwise
it's possible to log in to the Newbeat site and download it there as well as
the updated manual. Good work!
Visit New Beat to download or getting more infos.
See a screenshot of ACE Midi.

Hi,

I have updated the Eiffel firmware 1.0.9 and the hardware (backwards
compatibility), there are some changes and a new cool feature...
An LCD display 2x16 for see clock, temperature, an user message of 8
characters.
Now there are a full Hypertext documentation, and the schema.
There are also an example in C for send the LCD message to Eiffel.
Eiffel works witout keyboard driver since v 1.0.7.

Regards,

Didier.

Anyone ordered and used this High density adaptor?

I've been away from the scene for quite a while, but some time ago I worked hard trying (with the help of several other Atari ST users) to develop an adaptor like this which would work properly, without any "buts" and "ifs" -in other words, a circuit which would detect the density and change the clock rate and step-rate.

From what I gathered, the best and easiest (construction wise) way to do this would be to use a pre-programmed GAL chip, but I never had the knowledge for designing something like that.

So, does the mentioned circuit use a pre-programmed GAL for changing the step rates, or is it another spin-off of the many circuits freely available on the web?
It claims to fully automatic change the step rates and be able to boot in HD mode as well as in DD without any additional software.

It uses 2 standard logic IC's, no GAL's, why would anyone want to use a gal
for very basic logic functions ???. No software needed to function.

There are countless "spin off's" on the internet, AFAIK, my board is the
only one which doesn't require software. This was the goal some years ago
since at the time there was no modules which would be fully automatic, they
either needed a TOS patch, or boot from a floppy to patch TOS, or a
reprogram of the TOS chips, which ever way was a pain, which is why I
designed a "no fuss" solution. STE's seem have have a default of 6ms so it
makes it a lot easier for them, my board fits ST and STE.

This lets me think it's a bad contact with the expansion slots, maybe a
pin that got unsoldered due to plug/unplug ?
If this happens even without the CT60, I'd rather suspect the RAM
expansion slots and check all solders there.

Source record: 16534

Hi, Mickael!

Sorry, but those files don't reveal which WACOM tablets are supported.

The WACOM Stylus is mentioned.

Simply try the driver, that can't do no harm ;-)

In the text the required DIP switch settings are given, thus if your
tablet has no switches it might not work:

- Wacom II command set
- data format ASCII
- working mode Point
- origin: absolute
- unit millimeters
- conditional transfer

- 9600bps
- no parity
- 1 stopbit
- no DSR-check
- 8 databits

- maximum transfer rate
- origin upper left corner
- beeper on
- data end character CR+LF

You have to put the WACOMDRI.PRG into the AUTO folder - as the first one
if possible.

You have to put WACOM.ACC and WACOM.RSC into the boot drives root
directory.

The program and the accessory need each other, they won't word
standalone.

You have to open the accessory and leave its dialog via [OK] - this
activates the driver, [ABBRUCH] (cancel) deactivates it.

Regards,

Alexander

5440. Type of cables w/ FDI - DAT?

If it's the standard SPDIF I think it is, you can go pretty far with pretty standard cabling. AFAIK standard RCA will work perfectly. It'll either make a connection or it won't, there won't be any signal loss or anything if you use crappy cable because it's digital. With optical you don't have very much in the way of distance restrictions, however it's expensive for longer lengths.

Thanks,
Mark

looking for a good home!

i really liked my STe and its 4 meg'o'ram and colour monitor... i bought soooo much software for it back then... bunch'o'music stuff and a number of (then) cool graphic apps: the entire Cyber series and the next gen of 3D stuff that came out including Chronos... it's pretty much a full system (ie: there's good software in almost everything from graphics to music to word processing to business, you name it... even a few good games like the original Civilization and Monkey Island :)

also a LOT of magazines including an almost complete collection of ST Format (only a couple issues missing).

sorry don't have complete listing, but i'm initially looking/hoping for someone in Vancouver area to be giving a response... if not, i'll look into doing a paypal or ebay thing and will dig up more detailed desc.

i've got a rough idea what i'm looking for for a sale price given what i've seen posted here over the last few years, but i'm prefering to find someone who'd like a complete setup to add to theirs rather than selling it off bit by bit... partly expendiency, but mostly just cuz i don't like the thought of it being scattered all over the place :)

IRC is way better.. If you atari guys have permanent internet connections
to your atari's you should idle in irc with atarirc, fracirc or ircii. I
know frac doesn't run for me right now, But I've been hunting that bug for
a while in the source thanks to topp.

You can also use something similar to the java webchat on
http://www.drivemeinsane.com. It's just a java irc client but also much
better than using an always refreshing klunky web interface.

Thanks,
Mark

From your description, these sound more like voltage regulators to me. They would also act as filters in rejecting hum and noise, but their main aim is to stabilize the voltage a +5V. Of course I may be wrong - I haven't looked at the diagrams.

Since your Falcon occasionally works but mostly doesn't, there's a
contact somewhere that is not always contacting! I'd search the
motherboard for tiny pieces of solder that might be shorting pins or
obviously damaged traces (I hope I'm wrong, but a hairline crack on
the motherboard would cause intermittent problems). If you don't find
anything, you need a tech to go over the Falcon, and the only one I
know of still in the business is Rodolphe.

If Mark thinks its the motherboard, I'd go buy some shipping
materials.

I dunno. I'd tend to believe that because there's nothing else to
believe, but how about this. When you start it up, you get a white
screen, but if you hit the reset button and I mean ONLY the reset button
it works fine. So, I have my doubts that any traces are bumped into when
you do this. My guess is some capacitor is leaky or something and after
the thing is up and running it properly energizes and lets the system boot
right. But even that doesn't explain why some presses of the reset button
yield no success while others do. If he sends it back to me, I could
attempt to fix the audio but I don't know if I'd be able to find the cause
of the white screen problem. I could of course just resolder all the pads
of the ST-ram card and do other things until some good results occur. I
have no idea how to test a capacitor though ;-)

Thanks,
Mark

Sam,

Just a thought... Have you checked your ST-RAM memory? I once purchased a 14Mb memory card to upgrade from 4Mb. It was this ugly-looking redish-pink colored, really long card. I put it in, turned on my Falcon, and got the exact same symptoms as yours. It turned out, one of the solders on the under-side of the card were touching the metal top of a capacitor. Not a good situation. The only way to keep it from happening was to use a piece of non-conductive material (plastic) to cover the capacitor. Bad memory card design, I think. Anyway, if something is happening with your memory, that could possibly be a problem. Maybe?

Doesn't it work after you hit reset a couple times? I didn't have a
problem getting it booted up. But you know this is a blessing in
disguise. If it breaks reliably it'll be easier to fix.

Thanks,
Mark

8-Bit Classics is an online commerce store specializing in the classics video game and console systems. In the past few weeks, we have added some cool features.

The store now can now be searched on Froogle (froogle.google.com). Here is a direct link:

http://froogle.google.com/froogle?q=store%3A8bitclassics

Or you can do a general search on products in Froogle and if it there is a match, our Inventory will show up.

We have updated the style of the store to a little more high tech look. We have also added features like a Poll Booth, Currency changer(non US Dollar), checkout without being a member, and forums.

Current poll asks, "What is your favorite 8-Bit computer system?", vote now for your favorite. Past poll was "Are you planning on purchasing the Atari Flashback?", 75% no, 25% yes.

Don't forget to use NEW20 when checking out to save 20% off your first order.

I haven't had a lot of time lately but, for a couple of days after I got it back, I was able to fool with it. However, it seemed to take steadily more resets to get things going.

So, for the past 3 days, and only spending a small amount of time, it has done nothing but give the white, blank, screen.

I'll fool with it tonight. BTW, Rodolphe says "Check a problem on a pin of COMBEL ...with a magnify ....
Touch each one a see if one is not moving... may arrive when you move the mb from a case to an other...."
Where the heck is the COMBEL?

Hi All,

Okay, I do all the initial things in HDUtility to pre-prep the hdd. I reboot, with the hddriver (backup of course) disk in the drive. The bootup is fine untill it sees the hdd because right after that I get an 'EXCEPTION PROCESSING 4: Illiegal Instruction. Then a bunch of stuff (intelligable but I don't understand it) and the boot process stops. This has happened on both the 30gig and the 4gig drives.

What does it mean? How do I fix it? This is one of the rare moments that my Falcon/CT60 is actually booting all the way!! :)

Thanks,

I seem to remember Michael Schwingen had a design in a GAL that altered the step rate. Probably why a GAL is best. I have a GAL programmer for Atari ST/TT/Falcon along with the software that I may part with. All in box with ZIF socket and probably a few GALs kicking around.

Yes, I was in touch with someone a while back who had designed one with
a GAL, but I can't remember offhand who it was, other than a German
company who used to sell them, but not any longer.
So the guy in charge said he'd consider making the circuit publicly
available. This was a while back, so I'll see if I can find those old
emails and ask about it again.

Was Michael Schwingen's design available freely? Do you have that
circuit of his?

Okay,

Last night I was actually able to use the falcon/ct60 for about 1 1/2 to 2 hours. Then after that, it would not boot the drives i.e., the white, blank, screen thingy.

So, if anyone can tell me, step by step(cause I don't see a logical process in the HDDriver manual) how to intall HDDriver and prepare a hdd using (partitioning a 1.2gig hdd) , I would be very happy.

If I can get the hdd prepped, load Magic5 and all the other stuff, I should be okay. I'm pretty sure I could use it all friggin day, so long as I don't have to reboot.

Hey everybody, thanks for all your suggestions/ideas etc., and please accept my apologies for being such a pest for the last 2 months or so.

Thanks a bunch!!!!!

Just partition it. I would do two 600 meg BGM
partitions. Once you partition the drive, reboot and rerun hd-driver.

Now those partitions will be detected. Go in and initialize those
partitions. The menu option might actually be "zero partition" i can't
remember. I think zero is an AHDI thing. Once this is done, click on the
very right menu and there should be an option for IDE disks. Click that
and then click the button that says "Modify HD-Driver". Then go to the
file menu and click install hd-driver. That should be about all there is
to it. After you install hd-driver, then go modify all your options like
partition and drive checking, etc. If you only have one IDE drive, the
the second IDE drive out of the boot scan, it'll boot faster.

If you need to know a good set of options, I can write them down for you
when I am home later, but honestly all you really need to do is hit
autoconfigure and it should take care of it.

Thanks,
Mark

Hi Greg,

GG> This starts at 10:00 am CST/16:00 UTC.

I'm in the "Central" time zone, but due to "daylight saving"
we're in Central Daylight Time (CDT, which is UTC-5 hours)
until 02:00 CDT on 2004-10-31, when we switch back to
Central Standard Time (CST, UTC-6).

I missed last Sunday's chat, which might have started at
15:00 UTC (10:00 CDT). I'll try to make it there for this
coming Sunday, aiming for 16:00 UTC (10:00 CST). I didn't
miss the chat due to the timezone thing, I was just not near
a computer.

Regards,
- Andy Ball

P.S: I'm told that now is as good a time as any to replace
your smoke alarm batteries (perhaps they think we're
buying batteries for wall clocks. :-) Zinc Carbon or
Zinc Chloride are probably best, but check your smoke
alarm's manual if you have it.

Nothing is wrong with IRC, except that I didn't know about the channel till
you posted it as a rebutal to this chat. Glad the IRC chat is there, and
anything else out there for Atari.

And hopefully see you and everyone else next Sunday. :)

If in the US, you can only use us.ircnet.org or irc1.us.ircnet.com.
stealth.net has been down for a very long time now. US users
unfortunately have big troubles using IRCnet, but none of the euro guys
care ;-)

Source record: 16469

Hi Folks,

I have a leftover 20 GB hard disk from a laptop computer upgrade. It's an IDE Fujitsu MHM2200AT.

The pinout looks identical to the 2.5" IDE drive inside the Falcon, although this drive is about half as thick.

If it's possible to use this drive, is there any software available that would be able to format and partition this drive for the Falcon?

I have the ICD Pro utilities with HDFMT.PRG version 6.23. I suspect that it is too outdated to work on a hard disk of this size. I see that ICDFMT.DAT lists drive parameters, so I wonder if there are more updated parameters available... Or if it would be worth trying to add them for this drive?

Thanks for any help.

Thanks Mark,

Looks like Rodolphe was right. The falcon/ct60 boots just fine, regardless if its reset, contro alt del, or cold start.....so long as I'm pressing down a bit on the (as you look at the falcon as if its a desktop case) front left corner of the COMBEL chip.

Now my floppy (atari) is seems to be acting up. I've tried using pc fdds, bot the falcon doesn't seem to recognize them. Any ideas?

Thanks,

I am in the market for any one of the following Atari systems...

-520STE (preferably upgraded to 1MEG)
-1040STE
-MEGA ST (not STE) 1,2,or 4 MEGS

I am also looking for the following Atari hardware...

-SM124 monitor
-MEGAFILE HD for MEGA ST

I am interested in items that are in good working order and that are
in very good to excellent cosmetic condition. (IE : No discoloration,
no yellowing, no missing screws, no cracks, etc...)

I am in the U.S. / Atlanta, Georgia

If you have any of the above items up for sale please email me...

Thanks! :-)

Hello,

I'm proud to release the first public version of Zview.

The main goal of this software is to be the USB camera manager for the futur extention form Rodolphe Czuba and the group Nature(nevertheless, the port of libsane will be not from myself).

For now, you can use it like a picture browser/converter/viewer; it's decode all the variant of GIF, JPG, IMG, PNG and also the uncompressed degas and neochrome images and you can save in JPG format.

You need a FPU and a VDI with EDDI (nvdi >= 2.5, nova VDI, fVDI, etc) but if you want to make a catalog of 200 JPG, a CT60 or a Hades will be the minimum.

I hope that it will be usefull.

http://zorro.arcadia-crew.com/zview.html

Will it fit the Falcon?

It probably will work but, from experience, you may find the mounting holes don't fit the bracket and the shield will need cutting to clear the cable end.

Rodolphe,

I 'm pretty sure you just diagnosed the problem. Last night I was able to completely boot the falcon so long as I put a little pressure on the left front corner of the COMBEL chip.

My eyesight isnt that good and I didn't have a magnifying glass, but it seems the the COMBEL either needs re-soldering(?) or (I hope not..hard to find?) needs to be replaced.

Thanks,

Sam,

When you feel it's appropriate, you can send your Falcon back to me and I
will repair the pins of the Combel. Man, Rodolphe is a friggin genius
isn't he? I can also get the parts and attempt to repair the right
channel of your audio. I think I have an FDD you might be able to use
too. I can check my headers to make sure i didn't bork your FDD stuff.
It could be my fault you're having floppy probs.

Thanks,
Mark

The chip is not defective. Pins just need resoldered. A very challenging
job but my iron and super-fine tip is up to the job.

Thanks,
Mark

Hi Steve! Just the usual, establishing a stable 44.1 clock from a cd
burner to the fdi running CAF. I've done it before with no problem,
but have been getting an unstable signal or digital loop message from
CAF. I guess I'll try better quality cables and see if that makes a
difference.

The old Tuesday night Delphi Atari chat is still going on, but now at
www.atarinews.org BBS system.

Tuesday Nights at 9PM EST (-5 GMT)

To access the bbs system,
telnet or ssh to www.atarinews.org

username and password to enter the bbs are "bbs"

Create a user account(if needed or enter your user info), when you are
on the system type "t" for talk and then "c" for chat.

I just wanted to stress that this channel exist some 10y and bunch of
ppl visits it (we dont visit #atari anymore, mainly because it was hacked
many times and also havent much incomon with Atari...). It is a bit hard
to came in at proper time, since we are scatered arround the globe... Also
deadline for DHS compo is approaching, so that also keep some ppl off and
rather coding :)

I'm about to send the contents of several floppy disks to someone, and making "disk image" files of them would be a good idea to make it as easy as possible for the recipient.

Anything like that available for Windows?
And if the recipient uses a Mac or Linux, does it use some sort of universal format which could be used there as well?

I've been able to find the German demo of "MagiC-PC" (Atari ST emulator
for Windows), but isn't there an English one around?
I used to have an English demo for MacOS, so I assume there's one for
Windows as well.

If so, where can i download it from?

This is a message from your CT60. It is not happy with something.

I wish my memory was better, but I recall getting HDdriver running at
first on my CT60 was difficult (using a very recent version -- 8.13?).
Have you tried the alternate boots yet? Since I don't have the clock
patch removed yet I have to run my CT60 by holding <Ctrl>+<L-Shift> at
bootup to keep TOS out of RAM. (I think it also does something else.)
If I do this, crashes are infrequent (although ZBench gives me a
score much slower -- about 50% -- than I'd expect). Without the boot
keys, my CT60 will crash in seconds.

Try the ICD tools. They might well work. Note that TOS 4.04 has a 1
GB partition limit, so you will not be able to use all 20 GB without
supplementing your OS.

Hi all
when fitting the CT60 with solders does pin 8 of U63 need to be cut or bent up before conecting? Also it appears from an earlier modification that pin 10 (2 to the right of pin 8 looking from the front of Falcon MB) of U63 is cut, would this need to be rejoined?

Thanks

Everything I see, and the way I installed my falcon myself, suggests the
pin that this wire connects to should be in the socket and proper, not
bent up. Have fun with that :-/

Thanks,
Mark

See http://makedisk.atari.org/ - for Windows in particular "Windows
Floppy Copy" might be of interest.

> And if the recipient uses a Mac or Linux, does it use some sort of

The emulator format .ST and the scene format .MSA are well accepted
standards. Both can be read and written on Atari ST machines directly.

I've rather lost track of MagiC PC, but you should be able to anglicise
the interface and CPXs by copying MagxDesk etc from an Atari MagiC
version. That would leave the config menu and any error messages
produced by the OS.

> I used to have an English demo for MacOS, so I assume there's one for

You would probably be advised to try the above, or ask Oliver Buchmann
at ASH.

Greetings All,

I bought a PC-Notebook about 1-1/2 years ago and
only use my Atari computers for serious work. I use
the PC for the Internet only.

So I think its about time to force myself to get familiar
with "Windows XP-Pro". So could use some help with
the following questions?

1. Should I partition the 20-Gig Hard Drive, and if so how
is it done??
2. Are there any good Utilities available for the PC like
a good File Selector??
3. Or should I just look around for a good O/S, :) ??

Thank for any Help, Donner.....

5521. GFA Basic game programming advice needed

Newsgroup: comp.sys.atari.st
Date: 2004-10-29 18:04:37 UTC
From: wboblitt@comcast.net
Message-ID: <83ffb5ca.0410291004.5fe43eba@posting.google.com>
Source record: 16415

I am a long time ST/STe/Falcon owner and user (as well as game collector) and I have recently decided that I would like to program some ST games. After reading through some ST Format magazines I had lying around, doing some usenet research and web browsing, I decided that GFA Basic was the way to start for me. I also like many of the ST games I have seen done in GFA.

M.A.G.E. by Majicsoft also seems very interesting, but unfortunately seems like it is impossible to find anywhere.

I prefer to have real copies of any software and manuals I use. I don't mind shelling out the money.

I would appreciate some advice from any programmers out there about what books are good to start with for a beginner, or any comprehensive online tutorials available. I did find one tutorial that looked good but it ended abruptly as it was unfinished. I would especially be interested in anything that deals with sprites, collision detection, joystick/mouse control and the like.

I have only done minimal Basic programming on the 8-bit years ago.

My ultimate goal would be to complete 2 or 3 arcade action type games. One idea
I have is a variant on the arcade game "Zookeeper" and the rest of the ideas are all in the same ballpark as far as processing power needed. Basically nothing more complex than a circa 1983 arcade game.

So far I have had trouble locating a full version of GFA 3.6 with manuals. 16/32 in the UK had one, but it only had the 3.5 manuals. I am not sure if they had specific 3.6 manuals for GFA but I didn't want to take a chance until I knew for sure. I have a GFA 3.5 on a disk from ST Format but the documentation in the .txt files leaves a lot to be desired.

I am already working on the sprites with a sprite editor and animator, music, and the logic for my ideas on paper with flow charts etc.

The computers I own currently are an STe with 4 megs, TOS 2.06, and a 16mhz accelerator, and a stock Falcon 030 with 14 megs.

Please leave any reply here on usenet and I will check back. Thanks.

At this point, crappy is too kind a word. The floppy drive is getting testy as well. I now have to put some pressure on the COMBEL in order to be able to use the fdd.

Let me know if you are still willing to take this baby on!!!

I don't have time to mess around trying to find out what'll work, how to set things up etc. so....

of the many Atari ST emulators available for Windows, which one is easiest to set up and use?
I believe that some of these emulators are made just for .ST or .MSA disk image files, but I need to run a few simple ".PRG" or ".APP" programs, preferably in hires mode.

Message-ID: <83ffb5ca.0410291238.4af97def@posting.google.com>
Source record: 16418

Just thought I would "TOS" this out there. (get it??? I'm just killin' myself here!) I have been trying to get my STe in top working order. I have had problems with it ever since I got it it 1995. It has an Adspeed STe board in it, and TOS 2.06 on socketed chips. It seems like every few days, especially after heavy use or on cold mornings I would turn it on to a blank or bombed out screen, forcing me to open it up and press the TOS chips in with my thumb. (or less frequently twiddle with the Adspeed board or 4 meg memory chips) Eventually I just left the top off of the thing, since there was no point screwing it together. The floppy drive just sat on those plastic posts with no screws, and I had to hold the back of the drive with one hand and insert floppies with the other. Very annoying, but I kind of got used to it. Finally a few weeks ago I decided to start using my STe again regularly, and that I had to try something to fix this problem. What I did was take out both TOS chips carefully with a screwdriver (VERY slowly and evenly, never lifting more than a millimeter at a time from either side), remove the Adspeed board, and take out the 4 megs of memory. I sat for 20 minutes rubbing all of the metal contacts with a pencil eraser. Put everything back in the computer, put the case back on with screws and have never had to open it again since! I know it is sort of common sense in a way, but it is easy to think a computer is flaky just because it is "worn out", and this is an example of a perfectly functioning machine hampered only by a few microns of oxidation on some metal contacts.

Thanks.
I'm running into problems here (as usual with computers), but the above should be at least partly helpful.

I've got several floppy disks which I need to send someone by email. The files are on the Atari Mega STe, and I somehow need to transfer them over to the PC which runs Windows ME (I can also boot into Mandrake Linux 10.0).
The biggest problem now is that I can't read floppies that have been formatted on the STe (even with formatters that are supposed to do proper MSDOS formatting). When I put them in the PCs drive and try to access the floppy, I get an error message saying it needs to be formatted.
But when I format it on the PC I can't read it on the Mega STe.
Bummer! :-(

Is there a solution to this problem?

As for finding a common file-format to use...
I've been using "MSA II" on the Mega STe to make .MSA disk images, and I suppose the recipient could make these files into Atari ST readable floppies from their PCs using the program you mentioned here.
But first I have to find a way to transfer the files from the Mega STe to the PC.

BTW Mark,

As it turns out, it's not the falcon's fdd that's bad, it's whatever the problem is with the COMBEL. If I constantly apply pressure to that chip, then everything appears to operate just fine.

Anyhow, I won''t be needing that fdd from you after all.

Remember, I'll send the falcon to you next weekend, not this coming weekend. :)

I would do this. Boot up your computer without the hard drive, but
make sure your hard drivers are on and connected. Then run the
HDDriver program and that should allow you to have access to your
hard drives. Run the Hddriver utility program and set everything
up. Save a SYS file to what ever partition you have selected in
the Hddriver utility program. Reboot and the hard drive should
load. That is the way I did it.

Hello Donner,

1) My son's notebook does fine with one big partition, but I will
make about 3. I would use one for backups and the others for
everyday use.

2)Do not know this one, but I would imagine they are out there
some where.

3)If you can install Linux, I would do it. Nice OS...

Edward,

>Run the Hddriver utility program and set everything
>up. Save a SYS file to what ever partition you have selected in
>the Hddriver utility program.

The thing is that my hdd has never been prepped for the falcon.

I think my problem is in the initial setup phase. I must be doing something wrong during that process.

I boot with a flopply not containing hddriver.prg. Then I put in the HDDriver disk and run the hddrutil.

Next, I locate hddriver.prg. Then I go to tools and run the device check. Next, I cancel out of that and run Auto onfiguring, and when it's done I cancel out of that.

Then I do the General, Boot Parameters, and the Removable Media from the Settings Menu.
Then I quit Hddrutil and re-boot. Then when it reboots. I get: Exception Processing 4: Illegal Instruction. Then a bunch of other stuff.

So what the heck am I doing wrong?

Thanks,

As to file selectors, one resounding NO, or non-resounding nope.

A programmer I know still uses Windows 2 for programming, because the one good file selector he knows of was never upgraded, or downgrades, for the next poor try by Microsoft at writing an operating system.

On other topics, get Partition Magic, and follow directions.

Other utilities, see Norton.

Jim

Hi Gamer,

Are you running "LINUX" on your HADES? I've never
used it on the Atari's and would not have the foggiest notion
of how to install it on the PC. without a Auto folder and a
Hard-Driver Prg, I've no clue as to what this PC is doing, I
get the feeling that windows wants you to be totally
dependent on windows.:^(

Later, Donner......

Easiest to use is SainT, http://saint.atari.org/ but it does not feature
hires emulation nor filebased access (harddisc emulation), only support
for disk images.

Best is surely STEEM, http://steem.atari.org/ but its GUI is not that
easy and it requires configuration for a non-gaming setup.

HTH,
Matthias

I seem to recall electronic engineers have a special tool for this purpose,
a sort of fibre-glass eraser which is highly abrasive and rips oxide off at
light speed - used one myself to fix a similar problem on an A500, and it
worked like a charm :)

If you're gonna try Linux - then I would highly recommend Mandrake Linux.
Its geared toward desktop users.

I have an extreme dislike for anything Microsoft... :-)

5540. Can I do anything with a 520 STFM without a mouse?

Newsgroup: comp.sys.atari.st
Date: 2004-10-30 14:22:12 UTC
From: Tim <bollox@bollox.com>
Message-ID: <ef87o0tkp25q0en67in5j1257ogcv3qju5@4ax.com>
Source record: 16434

Hi all.

Hope this is the right group to post this - if not, please accept my apologies, and I would be grateful if someone could direct me to a more appropriate group.

I've got an old Atari 520 STFM, but I have no disks for it, and no mouse. I have hooked it up to a TV via the RF output, and it seems to work, giving a green screen with menu headings along the top, and what I assume is a mouse pointer in the centre of the screen.

Pressing any key on the keyboard causes a "pip" sound from the TV, but little else happens.

I cannot find any key combination that allows me to access the menus at the top of the screen. I've tried googling, but all the FAQ pages I've turned up assume that you have a working mouse attached to the machine.

Can anyone help?

Thanks!

Try pressing ALTERNATE + one of the cursor keys to move the pointer.
Press ALTERNATE + Insert for left click, ALTERNATE + Clr Home for right
click.

Hey Mark,

You are not going to believe this but, I must have re-booted my falcon at least 15 time between the time I sent the reply in this newsgroup and today. That is to say the reboots were accomplished without any pressure on the COMBEL chip. I think the reason for this is, a couple of time I got a bit frustrated and put more than a little pressure on the chip.

Anyhow, still having problems with HDDriver. If Uwe had a contact email, I would explain exactly what's happening and what equipment I'm using.

I just downloaded the latest (20041029) CT60 config. file from Didier.

Can that be setup to boot from/run from floppy?

So we'll so how the falcon hold out between now and next weekend, I may not need to send, but probably will just to be safe.

Thanks,

Boot from your copy of HDDriver, run HDDrutil, Medium/Partition, and
chose a suitable scheme - you should however limit your C: partition to
less than 16Mo, for TOS compatibility.
Then, go and have fun during the partitionning and formatting (IIRC).
When all is done, set your system as described in my previous post,
then all should be OK.

Well, I think I'm suffering from the poor SIMM problem with the CT60.
Here's what its doing:

In 030 mode, 640x480-256 colors, running the Thing desktop, everything is
fine.

In CT60 enabled mode, same setup, icons in Thing have funny, fuzzy colors
along the top edges.

In CT60 enabled mode, same setup, running under Mint/N.aes 2.0, Thing has
the funny, fuzzy colors along the top edges of the icons, plus the mouse
pointer is invisible at first, until I click it a couple of times. Also,
the mouse point leaves "blocky" pixel patches in the menus once its run
through them. Worse, its very unstable. I can click on configuration and
it crashes back to N.aes.

I've got a DEKA keyboard interface. I'm using a 60ns, 2 cls, 256 meg SIMM
from Crucial in the CT60. I've got a 14 meg Wizztronics RAM board in the
Falcon itself. I also have the original Atari 4 meg board. I've tried both
boards and the problem shows up with either one in place.

I have the CT60 installed with *no* solders.

Anyone have any ideas or suggestions? Thanks!

Hello Sam,

You wrote...

>> I think my problem is in the initial setup phase. I must be doing something
>> wrong during that process.

I haven't got my Hades to hand in order to check this out, but do you
remember to "Install" HDDriver. It's on a menu option somewhere to
the left, and when you do it, it writes the HDDriver .sys file to the
root of your C partition.

If you keep having to boot HDDriver off the floppy, then check this
out.

Cheers

Paul

5549. CD-ROM drive on Atari STe

Newsgroup: comp.sys.atari.st
Date: 2004-10-30 21:12:28 UTC

I am trying to hook up a PROCOM (1993 Mac external SCSI) CD-ROM to my 4meg TOS 2.06 STe and after fiddling around for 2 hours with MetaDos, the SCSI ID switch etc. it is dawning on me that I have no idea what the heck I am doing. From searching usenet it looks like the driver that comes with MetaDos only works on some specific CD-ROM that I do not have. My questions are; can I run a SCSI CD-ROM chained off of the back of my Supra hard drive? Do I need some kind of Mint setup, or can I just run the thing with a stock TOS 2.06 setup? I would like to get this running so that I can have the Atari Compendium available while I am programming. Thanks in advance for any help.

This should have worked, and the only reason I can think of off the
top of my head is that perhaps one of your drives is a bit out of
sync? Try formatting the floppy on a third computer or using a brand
new preformatted diskette.

Other than floppies, there's always the options of null modem or
emailing yourself an attachment. However, floppies are supposed to
work on multiple systems. I use the same 720K floppy on an STe, a
Falcon, and Win98 on a regular basis.

What programs are you trying to run?

I use Gemulator (Jun 22 2000 version, NOT the last version) for my Windows Atari emulation needs. It appears to run every GEM-based application I've thrown at it. Gemulator does not care for non-GEM software much, but most applications use GEM. Please note that I have had trouble with Gemulator under WinXP, but Win98 works fine.

STeem is looking increasingly promising. I ran the latest version a couple of days ago under WinXP and it ran the few programs I tried without any problems, including a few games. One limitation of STeem is that it cannot map the floppy to drive A:. However, it CAN map it as a hard drive sector like D:. (Don't remove the floppy while running the emulator, though.)

For both emulators you will need to have a parallel port printer. Neither can remap printing to the USB port as yet.

In short, I would try STeem first.

Galen

I'd recommend you purchase a copy of Linux (like SUSE or Mandrake), as
it would address all your questions.

First of all, all modern Linux systems have the to partition your
drive in order to install a "dual-boot" setup. That means that on
startup you can choose between Windows and Linux by pressing a key
(much like XBoot on the Atari). Hence they include the partitioning
software required. Your existing Windows files will not be harmed.

Secondly, between Gnome and KDE you are likely to find a file selector
you like.

Thirdly, should you dislike all the above O/S, you can (and probably
should in any event) install both STeem and Aranym. Then you can keep
the bulk of your existing software in use. There's no point buying
new software unless you want the new features.

Yes, I believe you're right.
Either that or the floppy is worn out/damaged.
I say this because I can't reproduce the problem all the time, so I
should probably go out looking for a pack of new DD floppies (they
usually cost twice as much as HD floppies even though they only carry
half the amount of data -if they can be found in any shops at all!).

> Other than floppies, there's always the options of null modem or
> emailing yourself an attachment. However, floppies are supposed to
> work on multiple systems. I use the same 720K floppy on an STe, a
> Falcon, and Win98 on a regular basis.

Well, the Mega STe isn't connected online, and I don't feel like messing
around with any cables for a "Ghostlink" connection either. Since the
floppy solution has worked I think I'll continue with that, only taking
care that I try to use disks that aren't worn out.

On another matter....
I've successfully set up the "GEMulator 2000" Atari ST emulator on the
PC, and can easily run standard ".PRG" etc. Atari ST programs from the
PC hard drive (I have STeem installed as well, but found it to be a lot
more complicated -couldn't figure out the virtual hard drive setup, and
didn't feel like wasting too much time with it).

So this means I can work with Atari files/programs on the PC as well.

I now have a bunch of ".MSA" disk image files I've made on the Mega STe.
I'd also like to store the contents of those disk image files on the PC,
so is there a way I can extract the actual files/folders of those disk
images on the PC, either from Windows or via GEMulator?
"MSA II" on the Atari ST only allows me to create a floppy disk from a
.MSA file, or create a .MSA disk image file from the contents of a floppy.

Perhaps if I could create a "virtual" floppy disk within GEMulator I could do this (sure beats actually writing to a real floppy disk just so I can copy the files/folders back to the PC har drive).

From past experience hooking up a CD ROM drive to a Supra hard drive depends
on what version the Supra adapter is. The older ones it was not possible, I
know this because I tried and was finally told it could not be done. Was
also told the newer Supra interface may work, but I never tried it.

CrimKingson <wboblitt@comcast.net> wrote:

> I am trying to hook up a PROCOM (1993 Mac external SCSI) CD-ROM to my

MetaDOS isnt easy realy.

Example CONFIG.SYS from long time used Atari ST

```
------------------------------------------------
; Geri¿½te/Devices
;
; SCSI 6: `TOSHIBA CD-ROM XM-4101TA' -> K
;
; BOS-Treiber/BOS drivers
;
*BOS, c:\auto\cd_boot\hs-cdrom.bos, K:14
;
; DOS-Treiber/DOS drivers
;
*DOS, c:\auto\cd_boot\hs-iso.dos, K:K
;
;
Config.sys An ascii file that describes the system configuration.
;
; Physical Basic operating system format
;*BOS, [Physical Bos driver][Arguments], [Physical id]:[DMA channel],
...
; Device # meaning
; 0 - 7 ACSI device 0 - 7
; 8 - 15 SCSI device 0 - 7
;
;The next line installs FALCON.BOS for SCSI device 6 (14 = 8 + 6).
;
; Logical DOS format.
;*DOS [Logical DOS] [Arguments], [Logical id]:[physical id],...
;
;The High Sierra driver won't be needed in most cases
;*DOS, C:\AUTO\HSMAY86.DOS, Q:Y
;
;The next line installs ISO9660F.DOS for MetaDOS drive letter Y
;(which has been assigned to SCSI 5 above) as GEMDOS drive R:. Note
;that a lot of applications can't access drive letters beyond P:, so
;you might have to change the drive letter.
;
; You can use statements as below to launch other applications.
```

;

This example will fit a Thosiba XM 4101 CD-ROM to CDROM
Device "K" on desktop. Usable with MetaDOS or SPIN!

Watch for loading DOS- and BOS-Drivers on the right device.
DOS- and BOS- Driver of that example are not from Metados package.
They comes from CD-Tools, what support a lot more devices.

MetaDOS ist crap and not useful for modern devices.

A better way is to use ExtenDOS. Much more usable and suppportet..
Work for CD-ROM an CD burners also.
<http://www.anodynesoftware.com/>

Your SCSI chain should look like this example:

(Host Adaptor)
Computer Supra CDROM
T-#########----#####---######-T
ID 7 ID 0 ID 1

T= Terminator
-= SCSI Bus (all in all not more as 2 meters)
#= SCSI Device or Atari

Parity on all devices on, TermPWR of all devices on.

VDI/NVDI?
Sounds like a driver problem.
(But also the rom is too slow)

Make shure all 060 patches and drivers are loaded from autofolder on
sequence as described on manual.

I tested some different 4Meg atari ram boards without any problem
on 060 mode, crapy colors i got without NVDI.

Now I'm having similar troubles with games. I've successfully written
a couple of games disks on a PC using Makedisk, and they work
perfectly in the Atari, except that whatever game I pick, I can't get
past the initial intro screens and actually start playing the game. If
I run them in SainT, the only way to start the game is to right-click
the mouse, but I have no mouse for the Atari :-(

Tried the key-combinations Matthias suggested, but no luck.

Any ideas?

Thanks.

5559. Data transfer

Newsgroup: comp.sys.atari.st

Maybe a silly question but if you don't ask you'll never know.
I have 2 Atari Megafile 60 with data that I would like to transfer to my
PC. Is such possible ? If so, how can I do that?
Thanks.

Right click on the mouse is fire on the joystick, you will need one if you
intend to play games ;-)

5562. [ANN] Cresus beta 8

Newsgroup: comp.sys.atari.st
Date: 2004-10-31 10:50:59 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <4184c392$0$15755$7a628cd7@news.club-internet.fr>
Source record: 16305

Bonjour :)

New release of my banks accounts manager named Crï¿½sus. You can download
the beta 8 on my homepage or directly in the folder:
http://rajah.atari.org/files/ -> cresusb8_uk.zip (170 KB)

Features:
- bugfixes:
- display error on balance amounts (cents in 'n.100')
- when confirming an automatic transaction, the changes
(date, checking, amount) affects only the one displayed,
not the next transactions.
(Thanks to Strider)
- BubbleGEM font height is no more set.
+ transactions filtering (tip: "Select all" selects only
the only remaining transactions)
+ transactions printing (see "Misc")
- GDOS or compatible (default) or GEMDOS
- A4 (default) or US-letter
- to printer or clipboard (metafile *.GEM or *.TXT)
+ transactions export, to text file with TAB for
field separator, and CR+LR for lineends.

Printing tests ware done with a HP DeskJet 500. Please mail me if you
encounter problems (bad margins ?). With NVDI and vector fonts, the
printing is pretty.

The 1.0 is near to completion, before Xmas. Lacks a tutorial in the
STGuide documentation, bugfixes and a few minor functions (remaining
test RAM). The import and stat/graphs modules will be coded only
if sufficient registrations and if truly needed.

Tchuss :)

Best to get an atari with ethernet. In theory you might be able to find
an MFM/RLL controller for PC, rip the internal disk mechanism out of hte
megafile and then read it on the pc, but things on the Atari were not dos
compatible back in the day. You'd need Linux with MFM drivers (which may
not have been maintained for YEARS), and you need Atari partition table
support.

Theoretically it could work but I've never heard anyone anywhere try it ;-)

I only have scsi mechs from newer drives like supra, etc. I know they
work on linux with /|\ partition table support.

Thanks,
Mark

If you want to play round a bit more with the system, there is a lot
of ST software you can download from FTP archives on your PC and copy
across on disk to use on the atari. (remeber to format the PC disks to
720k, unmodified ST's can't handle 1.44mb format)

The best archives are

ftp://ftp.cs.tu-berlin.de/pub/atari
http://www.umich.edu/~archive/atari/

Thanks for that - I will have a look around.

Thinking about getting hold of a joystick off eBay - seems like you
need at least a joystick or mouse to do most things :-)

From: Atari-Korps <news@atari-korps.com>
Message-ID: <cm3n5h$1qf$1@sparta.btinternet.com>
Source record: 16316

hi, I have recently purchased one of these units and I am waiting for it to
be delivered...
has anyone got any information on this model of Falcon..? is it different
from the MKI or the MKII?

I understand it was the last model produced by C-Lab,
it's housed in a box that looks rack "mount-able"..

the spec I have been given is as follows....

C-LAB Falcon MKX
68030er Prozessor, @ 32MHz
32MB TT-RAM
14MB ST-RAM
2GB SCSI-HHD

any information would be a great help..
kind regards

As Robert S. suggested in the first message, that is indeed, the culprit.

When I first installed my CT60, I disabled all the AUTO folder programs
because of a crash I was having. This includeded NVDI. I had not
re-enabled it yet. :-(

Live and learn. :-)

Thanks to all who replied.

I do not know the answer to your question. I do know that STeem can
read .MSA images. (It loads them as the A: and B: drives.) I do not
know if Gemulator can read .MSA, but I suspect not. Perhaps there is
a utility for the PC to unMSA? I do not use MSA myself, so I have not
paid attention.

> the following questions?
>
> 1. Should I partition the 20-Gig Hard Drive, and if so how
> is it done??

I would partition it and arrange it this way...
C is a primary DOS partition make it 3 times larger that XP requires - this should allow room for XP, the SP2 update and extra space for more updates. Once XP is running search for "partitions" in the help menu, this should take you to a disk manager from where you can select and format the rest of the HD as another partition.
Install any other software you have on this other partition eg X:\Program Files\software name where X is the drive letter.

The reason for this is that you then keep all your installing/removing/deleating file operations on this other partition (unless you re-installing the OS) so you can perfom them safe in the knoweledge that your not deleteing OS relevent files and thus your laptop will still boot up in the morning. Also move your "My Documents" folder to this partition.

As for software I have files for Win 95, 98, and XP boot floppies from which you would use Fdisk to format and partition your HD before installing your OS. You can either do a search for "windows boot disks" or I would E-Mail you one. If your Laptop came with a recovery disk that probably has partition software on it although you may have to select the expert as opposed to comsumer (or basic) option which would just create on partition.

> 2. Are there any good Utilities available for the PC like
> a good File Selector??

I'm not sure about this one but what I do to keep an Atari esq feel is to place shortcuts for my HD partition, Floppy Drive and CD ROM on the Desktop so that I can access them quickly as opposed to having to go through "My Computer".

5586. AtarICQ 0.161 is released

Newsgroup: comp.sys.atari.st
Date: 2004-11-01 09:44:04 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0411010144.2fab52b3@posting.google.com>
Source record: 16328

Hi all,

At last I got time to fix up documentation and stuff for the 0.161
release of AtarICQ! For those who don't know, AtarICQ is a GEM
application that allows you to chat to your friends via the ICQ
network. A STiK compatible internet connection is required and a
640x400 or better resolution is recommended.

In this new release you will find these most noticeable changes and
additions:

* Possibility to set how long aICQ should wait until a message is
considered to be read. AtarICQ will count the time from the moment
that
the user starts view a contact message with the message window topped!
If you temporarily have another window topped, aICQ will reset the
timer.

* Lots of general changes and additions to preferences for a change.
Check them out, should hopefully be logical to figure stuff out. If
not,
have a look in the HYP.

* A _very_ nasty bug fixed, which would make AtarICQ crash upon
certain
AV-messages. Thanks to Martin Byttebier for patience during tests.

* Internal handling of contact data has been reworked, allowing for
better
flexibility which might prove important for future additions.

* The routine for unshading windows now uses
WIND_SET(hdl&,22365,0,0,0,0)
to allow it to work also with new XaAES.

* Fixed a problem where TT-RAM would (if present) was reserved for the
DMA
sound buffer.

Read more and download AtarICQ here:

www.ataricq.org/

Regards,

Joakim

> kind regards

It seems that you have a Mighty Sonic 32 accelerator board or similar
as a stock MKX is 16MHz and no TT-RAM.

The MKI was basically a stock Falcon with the clock patch and audio
patch done by C-Lab. The MKII was also similar but it also included a
modded SCSI to allow for an internal 2.5" SCSI drive. The MKX is in an
external rackable case with optional internal SCSI and optional RCA
line-level audio jacks.

5588. "Discovery" cartridge info wanted

Newsgroup: comp.sys.atari.st
Date: 2004-11-01 11:06:39 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <418618b7$1@news.broadpark.no>
Source record: 16330

I've got a "Discovery" copy cartridge which I use to backup
copy-protected floppy disks.

It's a while since I've used mine, so I've got a few questions (hoping
I'll bump into someone here who has one as well):

a) There is no labelling on mine, so looking at the unit connected to
the ST cartridge port (i.e. the "Happy computers" label facing up and
the "pass through" cartridge connector facing forward), there are two
disk-drive connectors on the rear.
I understand that the rightmost of those should be labelled "Drive B" as
it connects via a cable to the external (floppy disk drive B) floppy
connector on the ST. Correct?

What about the connector next to it (to the left)?
(Looks like a floppy drive connector as well).

And what about the connector next to that one (the leftmost connector)?
Actually, there is no connector there on mine, just an unused space on
the circuit board, but from the holes and the silk-screen printing I
assume this one is also for a floppy disk drive.

b) As a DIY hobbyist I'm always interested in what's going on inside
electronic devices, so I opened it up.
The circuit board has a lot of unused space -room for additional ICs (a
couple of ROM chips?), a battery, one or two switches, several resistors
etc.
My Discovery cartridge is labelled "Option 0", and as far as I remember
from past discussions it came with several other options. Was one of
them to add ROM chips from an Apple Macintosh?
Were there other options available?

What your looking for is the Keyboard equivelent. It all starts with the Alternate key, left of the space bar. Hold down Alternate with the Arrow Keys for direction. Arrow keys are under the Help Key. Left and Right Mouse Keys are above the Left and Right Arrow keys. These are Insert and Clr Home. Also, if you include the Left shift key with Alternate and Arrow Key. You will get a finer movement of the mouse pointer.

Now, I sell Atari Mice and Atari Disk Drives. Should you decide to Buy one. E-Mail Atari@aracnet.com Thanx! ===Ben===

I wouldn't reccomend trying to connect Atari formatted RLL drive to a PC. It's still easy enough to come by RLL controllers for the PC, but it's unlikely the PC will be able to recognise the Atari partitions and format, and there is a chance that Windows will try o write to the drive and corrupt the data in doing so. best thing is to hook up the drives to an Atari (any ST can support the megafile hard disks) and then hook that to the PC for the serial port, you can get serial cables with both the old 24/25pin serial port connectors and new ones and both ends, they cable splits into two heads at each end.

GhostLink is the best software but it's fairly easy to rig up a link with other software, some DOS versions on the PC used to come complete with it's own transfer software, I think it was called InterLink.

The Supra interface is surely missing some of the SCSI-II command set.
Thus Audio CD, Photo CD, and CD-RW are very unlikely to work. Just
reading the CD might work however. The person to ask would be Roger
Burrows at Anodyne software. I'd also suggest reading
http://www.atarimagazines.com/startv3n11/smalltools.html and
http://www.anodynesoftware.com/egold/hardware.htm for some background.
While not cheap, Extendos Gold does work very nicely, and Roger is
extremely helpful should you have any questions.

The easiest method would be null modem transfer. ZModem should be
easy to find for the PC and exists as parts of terminal programs (like
STorm) for the ST.

Ghostlink is faster (as it uses the parallel ports), but I believe it
requires a special cable.

If you take the time to figure out STing, emailing yourself your files
also works quite nicely.

All programs noted above are freely distributible as far as I know.

I know you used to be able to set Atari support in the Linux kernel and it
would recognize Atari hard drives. I've never actually tried this myself
though.

Another good reason for using Linux or Atari over a MS product! :-)

In case you want to boot from your floppy disk drive there is nothing wrong.
As I already said previously, if a setup that has works fine for others
does not work with your machine it sounds like a problem with your hardware.

>> Windows Atari emulation needs.

> Is this still available any where, I could not find it on the Gemulator site

I ended up giving it a try (downloaded it from:
http://www.emulators.com/gemul8r.htm) and it works fine here. I couldn't
figure out STeem properly (too impatient) and have to say it seems to
work very well indeed!
And easy to set up.
The only thing I couldn't figure out at first was how to get control
back of the mouse pointer in Windows, but now I know that I simply have
to click *both* mouse buttons at once.

A question to other GEMulator users: is it possible to make the tiny (at
least on a 1024x768 screen) Atari ST desktop bigger -for example twice
as big?

That's correct -it won't work on a Falcon or a TT.

By the way, in case you don't know about the Notator mailing
list/website (with lots of downloads and a big FAQ) you're welcome to
join: http://www.notator.org

You're not missing much of interest, and you can easily download the
contents of that disk from many places, freely.

What you basically want is the "Xcontrol" control panel accessory, and a
few "CPX control panel modules". These basically allow you to set things
like the clock/date and so on.

If you're new to all of this you can download a TOS 2.06 user-guide (the
operating system you've got in your Mega STe) which I wrote a while
back. It explains everything in depth, and also uncovers a lot of
unknown "secrets" and tricks, along with links to downloadable sofware
(including the stuff you're asking for). It's all in HTML, so you can
view it on your PC, Mac, Atari ST or whatever:

It uses a normal parallel port cable (25 D plugs at each end) with 2
wires swopped over at one end. Buy a cable with plugs that you can open
the covers, the job's a cinch.

Hi, guys.
I just had a weird power fault in my area, the kind with blinking lights, and unfortunately I just had my falcon in the boot process.
Now, my boot IDE disk won't boot anymore. I can see it's there with my HD utilities, along with the ither IDE and the SCSI one, but I can't access it.
Looon g time ago, it happened something similar and I remember I had to reformat it. May I do something different now? Don't know, like restoring the boot sectors or such? Thanks.
Regards.

> as big?

There are two ways. <Alt><Enter> should give you full screen mode.
There is also a little AUTO folder program called WINSIZER that can
give you up to 1600x1200. You need to make sure you don't select
anything larger than your "real" resolution though.

Hey,

Well I'd say it's likely that you need to reformat it, but definitely
check first whether or not the drive is recognized and readable from
the hd utils themselves. You should be able to run ahdi.prg or
whatever and then be able to read from the hdd. if you can't you
probably need to reformat it. If you can, then you probably just need
to run consistency check and reinstall th hdd-boot stuff to the boot
sector.

Well, there are plans for making non-fpu machines into
fpu machines, involving mostly a fpu and ribbon cable.
I found one once, and probably have a copy on my home
machine. Google is your friend.

If there are no 68020 specific instructions, and time
is not a consideration, Zview could run on a suitably
modified ST.

Just a few slight corrections...

I had a MK-X Falcon for a while, and it actually came with 1/4" audio
jacks instead of RCA-type. Basically the type of connector you would
use to plug it into any common mixer board. Looked like 1/4"
headphone-type connector, only instead of a single stereo jack it had
a mono-jack for each separated left and right channel for both input
and output.

Also, I don't believe it was rack-mountable. At least mine didn't come
with any way to mount it. It was a desktop-style case. If you were to
put it into a rack, the keyboard connector (and joystick/mouse ports,
if you bought the PC-compatible keyboard model), MIDI, ROM-Port, and
Enhanced Joystick ports would be inaccessible. It was a nice case, but
didn't have much room for extra drives, compared to a tower-type case.
It did have two 3.5" drive bays in the front, but despite what the
original ads for it said, you couldn't put a CD-ROM drive in it as far
as I know. It only had enough height and width in the drive area for a
drive the size of your average 3.5" floppy drive.

Finally, another addition to the MK-X feature was the external
keyboard. You could get either a MegaSTe/TT keyboard, or a
PC-compatible keyboard with it, with the appropriate connector built
into the right side of the case.

A common side effect of a power failure is that the hard drive writes
garbage to a few sectors as the power goes down. While the drive
rarely "dies", the sectors that were overwritten might be blank, your
important documents, or the boot sector. A program like Diamond Edge
might be able to help, and there are expensive data recovery houses
that can certainly help, but for most of us the advice above will be
taken.

Galen (who remembers that he hasn't backed up his hard drive lately)

yep, seems it got corrupted and you need to reformat it (or just repartition it)...
data still could be saved, but I guess data recovery is too expensive...

Hi Mike,

that sounds good news about the input / output sockets, but not so good
about the case.

I am still waiting to recieve the unit and when i do i will post some
photos..
This Falcon comes with a Mighty Sonic 32 accelerator board. Is this just for
extra RAM
and the increased CPU frequency of 32MHz?

I understand that the falcon had an IDE connector on the motherboard. so i
could connect a 250MB internal zip drive / or Jaz drive (same dimentions as
a floppy drive unit).
How easy is it to connect a CD Rom drive to a Falcon (IDE / SCSI) are there
driver issues?

kind regards

That's strange.
I seem to have read many times that it's indeed a 19" rack module, but
perhaps I'm confusing it with another C-Lab Falcon version. Anyone know?
In any case, it would be logical for a computer designed for music to be
rack mountable (which is why I'm working on that for an STe).

Correct, altho' it would sit on a rack shelf with velcro.

> If you were to put it into a rack, the keyboard connector (and
joystick/mouse ports,
> > if you bought the PC-compatible keyboard model), MIDI, ROM-Port, and
> > Enhanced Joystick ports would be inaccessible.

Again, correct but using a Mega STE/TT kbrd and modding the dongle port gets
round this.

Using a skeleton/zimmer frame rack is a possibility.

> In any case, it would be logical for a computer designed for music to be
> rack mountable (which is why I'm working on that for an STe).

Still trying to reinvent the wheel, I see.

For info, I am still selling my versatile ST rack case kits from £25.

See www.keychange.co.uk for pic.

>I've got a "Discovery" copy cartridge which I use to backup

>I understand that the rightmost of those should be labelled "Drive B" ..
>What about the connector next to it (to the left)?

The connector closest to the computer connects to the computer's drive port (this is required even for computers without internal drive). The other goes to your external drive if you have one.

>And what about the connector next to that one (the leftmost connector)?
>Actually, there is no connector there on mine, just an unused space on

There was an option to connect a third and a fourth drive.

>My Discovery cartridge is labelled "Option 0", and as far as I remember
>from past discussions it came with several other options. Was one of
>them to add ROM chips from an Apple Macintosh?

Yes, you could install MAC roms, real time clock and a couple of other options which I not recall right now. I think all the options are documented in one of the readme files.

PASTI
Atari ST Imaging and Preservation Tools

Pasti is a package of sotware tools for imaging and preservation of Atari software. The two major components are the imaging tools and the emulation helper tools. The imaging tools produce a disk image file from an original disk. It works very similarly to standard imaging tools like Makedisk, but they can image virtually any ST disk including copy protected disks. Imaging tools are available for different hardware setups, including a plain Atari ST computer. Capabilities vary depending on the hardware. Specialized hardware is required for writing back images to a floppy disk.

SOFTWARE PRESERVATION

Our main goal is the preservation of Atari software in its original unmodified form. Original software is normally stored on diskettes with custom format or copy protection. Standard tools cannot back up or image them. But floppy disk recording have a limited life time. It won't take too long until all original Atari disks will be damaged and lost.

PASTI.DLL

Pasti.Dll is the emulation helper tool for Windows. It extends Atari ST emulators, adding support for extended disk images. These disk images support exotic, custom, and copy-protected formats. You can now use emulators to run ST software in its original uncracked form.

Barrie,

Will a Mega STe fit in one of those cases??
how versatile is your ST rack case..?

are we talking Mega 'ST' ? or something larger...

I might be interested in one, if you can give me some more info...on
internal dimensions and connections..

No need to 'rackmount' the Mega or Mega STE 'cos you can velcro them onto a
rack shelf.

> I might be interested in one, if you can give me some more info...on

If you don't like the MK-X case, there are actual rack cases
available. It isn't too difficult a job to remove it, if it's not in
the original Atari-design case (which went way overboard on shielding
and cramming things into tight places).

> I am still waiting to recieve the unit and when i do i will post some
> photos..
> This Falcon comes with a Mighty Sonic 32 accelerator board. Is this just for
> extra RAM
> and the increased CPU frequency of 32MHz?

I believe that was the deal with that card. Not entirely sure, though.

> I understand that the falcon had an IDE connector on the motherboard. so i
> could connect a 250MB internal zip drive / or Jaz drive (same dimentions as
> a floppy drive unit).

Depending on the options, some had IDE (2.5", not 3.5"), some had
internal SCSI. You'd have to find that out first. If it's SCSI, you'd
just need to spend the extra money on a SCSI unit. If it's IDE, you'd
need to make or buy a 2.5" to 3.5" adapter, as the cabling is
different (44-pin vs. 40-pin, I believe - extra pins for power on the
2.5" cable, I think).

> How easy is it to connect a CD Rom drive to a Falcon (IDE / SCSI) are there
> driver issues?

If it's SCSI, you can get an external drive and just plug it into the
SCSI-II port on the back. If it's IDE, it won't likely fit inside the
case, so you'd have to run a cable out of the case to it externally,
in addition to getting or making the adapter I just mentioned. Other
than that, you could also try your hand at re-casing your system in a
PC tower case, and then you'd have plenty of room internally for
CD-ROM and other drives.

There are a couple driver options:

Commercially, there's ExtenDOS from Anodyne Software in Canada. They
also make a suite of CD-Writer software for CD-R and CD-RW drives.
I've heard you can read DVD-ROMs as well, with a DVD-ROM drive. If you

get a CT60 with a 100MHz CPU, you can also view DVD's, so I hear,
using M-Player (the one ported from Linux).

A freeware driver called SPIN is also available. I've never gotten it
to work on my CD drive, however. It seems a bit more difficult to set
up, as well.

Hope this helps you!

It's relatively simple. Generate a hash of the every line of text from
the spam and store it. Strip quotes out on new messages and process every
line. If the hashes match up more than X times, flag the reply as spam.
bam the whole thread is killed. People who write software are usually too
busy to implement crazy features like that ;-)

That and it'd be a cpu/ram hog and a half and most people try to prevent
stuff like that, nonetheless the compile-time option would be cool ;-)

Thank you! Nice to hear :-)

> I am still looking for a Mega STE disk...

If you look through the abovementioned guide you'll find a software
section with downloadable links.
You can download everything that's contained on the Mega STe disk.
As far as I remember, the only thing it contained was the "Xcontrol.acc"
control panel and a few CPX modules (general, printer and so on)
-correct me someone if I'm wrong.
I have a Mega STe myself, but bought it second hand and didn't get any
floppy disk(s) with it.

Oh, there's a USA version of the "Xcontrol" control panel (I remeber you
mentioning you wanted the USA version).
This differs from the UK version in the way that the date is displayed
(month-day-year as opposed to day-month-year if I recall correctly).

Another thing.... as opposed to the standard ST, STF, STFM, STe
computers, the Mega STe can be run at 16 MHz as opposed to 8 MHz! You
can change between 8 MHz and 16 MHz with or without a cache -go to the
"general" control panel to change this -read more about this (with
screenshots) in the user-guide.
Good luck!

So that second connector basically acts as a "through" connector
allowing for an external (drive B) floppy drive?

>>And what about the connector next to that one (the leftmost connector)?

I see.
What kind of situations would call for such a setup?
I can understand 2 drives (copying a protected floppy to another floppy)...

I'll have a read through all the files that came with it.
The link you gave me however is a puzzle as I can't find anything about
the Discovery cartridge. All I could find was a couple of downloads for
STeem and some links.

>allowing for an external (drive B) floppy drive?

When the cartridge is inactive it is completely in pass-through. So that you could access the external drive as if the cartridge was not present. When the cartridge is operating some of the signals are accessed directly at the cartridge. They might still be in pass through, I don't know. The floppy bus is open collector, so it doesn't actually need to disconnect them.

>> There was an option to connect a third and a fourth drive.
>
> I see. What kind of situations would call for such a setup?

Well, I think the main purpose was to connect a 5.25 drive for PC disks, and still having two 3.5 drives. I would guess this was as uncommon as a PC with more than two floppy drives.

>> I think all the options are documented in one of the readme files.
>>
>> http://pasti.fxatari.com
>
> I'll have a read through all the files that came with it.
> The link you gave me however is a puzzle as I can't find anything about

Sorry, the link was just my signature (well, you'll find software for the Discovery Cartridge in the future there though). I was talking about the readme files on the disk coming with the cartridge. I think it was named options.doc or something like that. Let me know your email and I'll try to find it and send it to you if you don't have it.

5672. Looking for 1040STe Schematics..

Hi there
I'm in the process of putting this on the net.
Atari STe 520/1040
Computer Field Service Manual
Part Number: C302481-001 Rev A
August 1991
http://www.mevagissey.net/ATARIADS.HTM
The schematics will be going up next.
Cheers

I've been attempting to run MagiC on my CT60, and I think I followed the directions regarding the patch and stuff to put in the auto folder. But when it gets to the MagiC splash screen I get 2 bombs, then a scrambled screen. When discussing this on the DHS site, it was suggested that I try a different boot manager (I use XBoot,) but I still had the same problem. Anyone got any suggestions of things to check or try? Thanks!
Wayne

I use MagiC 6.20 with no problems. Patch the MAGX.RAM, use the magic
programs that come with and don't use splash screen... Everyone I know
tells me splash screen is bad on MagiC. Disable all auto prg's to test
except NVDI. NVDI's one of the good ones.

PS: MagiC is not stable for me on the CT60, but it's not stable for me on
MSTe, TT or plain old falcon either so ;-)

Thanks,
Mark

I had the same issue with my CT60 back when I first got mine over a 16
months ago or so. Not sure exactly what cured it but I am going to give
you many suggestions to try. First off, make sure that you have
CT60XBIO.PRG, DSPXBIOS.PRG, EXCEP060.PRG. Make sure that these files
come from the latest update and also that you have MAGXBOOT.PRG which is
3222 bytes big in there as well. There maybe a certian order that
things need to boot in. The way I set mine up is as follows:

MagXBOOT.PRG FIRST then CT60XBIO, DSPXBIOS, EXCEP060 in this order.
Then NVDI and after that CD Drivers and Internet stacks and on down the
line. The trend here is to load the important stuff first and then work
your way down the line. DISABLE any boot manager for now. I had major
problems with XBOOT and could never get it working with the CT60 for
some reason. What VERSION of MAGIC are you running remember if it is
older than version 6 these Magic patches may not work at all. I know
there is a guy in here that says he is trying to get Magic 5 installed
on his system and I think he will find that it will not work. ALSO one
other thing I found A LONG while back and dont remember where I found
it. But when the CCT60 first came out we had to create a folder on your
BOOT DRIVE (Ussually C:/ drive) called NVDI and place your NVDI.PRG from
the AUTO FOLDER into this NVDI FOLDER that you just created. Then place
in the AUTO folder a new NVDI.PRG that is only 440 byte long. From my
understanding during the bootup process with the CT60. The 060 has to
have the CACHES OFF then load in NVDI then turn the CACHES back ON.
this little 440 byte program does this. It turns the CACHES OFF then
looks for the original NVDI.PRG in the NVDI folder then after the
program is loaded it turns the CACHES back ON and continues on with the
bootup. What speed is your CT60 running at. Believe it or not I found
that my CT60 runs more stable at 72 mhz. Not sure why. I have tried
the 66.666 mhz oscillator and it actually crashed 2 or 3 times a week.
Now at 72 mhz. I have not seen my CT60 crash at ALL. I even had

Rodolphe work on my Falcon and take it up to a 25 mhz. system bus and it runs ROCK SOLID. Thank you to Rodolphe for that one.

Beyond that I am not sure. If you want that NVDI.PRG that is 440 bytes big let me know. I dont even remember where I found it to tell you the truth. So I cannot direct you to the right spot. But here is my e-mail if you want to get into contact with my personally:

f a l c o n 0 6 0 <at> a d e l p h i a <DOT> n e t

remove all spaces and replace what is inside <> with appropriate characters.

>

I would also agree with MARK on the SPLASH SCREEN. CT60 may have problems with that image during bootup. Not sure because mine has always been turned off for the most part. And DEFINETLY YES NVDI has to be ON. It is one of the good APPS to use. And YES DISABLE all programs not being needed to see what is causing the problem, especially any sort of BOOT MANAGER.

Not sure about the stability issue on MARKS computers but I have not had ANY issue with my FALCON since getting it back from RODOLPHE. What ever he did CURED my once a week crash. Sometimes its not even the OS's fault. It can be a poorly written OLDER app causing the problem. But everyone is quick to blame the OS. One could argue that that is what Windows problem is. But when your at work and you cannot even copy a file to the FLOPPY Drive without the damn thing giving a blue screen of death. And you dont have a single app open and it is on a fresh bootup. What do you blame then??? Defienetly WINDOWS. I have had as many as 15 APPS open on my CT60'ed Falcon and back when I first got the CT60 it would occassionally crash on EVEREST or some other older app being used at the time. Do you blame Magic or one of the 15 APPS you got open?? Probably one of the APPS. I have done this 15 APP deal after Rodolphe worked on my computer and have had NO issues what so ever. It is not unusual to have 10 apps open daily without shutting one of them down for 16 hours on end without issue. Maybe there is a setup issue with your computer that may need addressed. Let me know if you want to look into it further.

Thanks,
Carey C.

Er...I know I've been gone for awhile, but just recently I bought some
stuff from Bravo Sierra Computers. The service was fast and what I bought
arrived just as advertised.

Did I miss something, somewhere?

Thanks.

I do not have any problem while magic starts, itï¿½s exactly the same
magic before i used the ct060 hardware. Only the magic ct060 patch is
new on chain.

> then a scrambled screen. When discussing this on the DHS site, it was

I think that have to do with preselect sceen resolution.

> suggested that I try a different boot manager (I use XBoot,) but I

Yep, remove it. Try another one. (I do not us an boot manager)

(Splash logo on falcon do not work as color picture, itï¿½s black+white)

For the Falcon, as has been said the CTlink is best, a version of it
is being considered for the TT and Mega STe as well. For standard
ST/STe's the best bet is the EtherNEC board, which I think is no
longer in proudction, but it may be being remanufactured again fairly
soon. It is simply an ISA ethernet card running from an isa adapter
into the catridge port on a standard ST.

I doni¿½t know, i do not have one ;)

I used a rom port interface from elmar hilgart and it works
great with STinG 1.26, but it is also not longer avaiable.

WLAN Adapors are welcome :)

If your Atari had an Ethernet connection you could use the ftp
protacol. You can also do it with a Null modem cable connection
between the two with an Atari program called Ghostlink. Below is
a text file that describes it:

Ghostlink v1.02 Beta 02/05/94 Copyright Bitz 1994

What is ghostlink:

Ghostlink is a link between an Atari GEM Computer (Master)
and a MS-DOS computer (Slave)
It allows the drives (floppy, harddisk, CD-ROM) installed
on the slave to be used by the master as a GEM-partition.
It is possible to connect up to 3 PC slaves (on different ports!)

So, you can, for instance, import a picture stored on a CD-Rom
(connected to a MS-DOS PC) into Calamus!

Connection:

A simple nullmodem cable is required.

Installation on ATARI:

Run the program STMASTER.PRG

1. Select port & speed
On the left you see 3 channel boxes.
Set the wanted port and speed for channel 1:

- STANDARD All Atari's (ST/STE/TT/Falcon)
The standard TOS routines are used.
Select port & speed in the control panel.
(Select 8 bit, 1 stopbit, no parity, no flowcontrol)

- SERIAL 2 Only MEGA STE & TT
Speed: 300/600/1200/2400/4800/9600/19200
38400/57600/115200
On a MEGA STE, do not use more than 57600 Baud

- MODEM 2 Only MEGA STE & TT
Speed: 300/600/1200/2400/4800/9600/19200
38400/76800/153600
On a MEGA STE, do not use more than 57600 Baud

- MODEM Only Falcon
Speed: 300/600/1200/2400/4800/9600/19200
38400/57600/115200

2. Select the partition ID's
On the right side is the partition box. Double click on existing
entries to edit them, or click on ADD to add an entry.

Editing a partition entry:
- Select a local drive ID (this is the drive-letter used by
GEM to access the slave).
- Select a remote drive ID (this is the drive-letter used on
the slave computer).
Here you can also select "All existing drives"; this means
that with 1 local drive-ID, you can access all the remote
drives (the remote drives are showed as folders in the ROOT
directory).
- Select a channel (take 1).

3. Click on Save to save the settings, this will avoid you to select
all settings every time the program is runned.
(Note: the settings are saved directly into the program!)

4. Click on install. The program will quit but remains resident.
Just install the icon(s) for the LOCAL partitions on the desktop.

The program can also be installed in the AUTO-folder, this way
the dialog does not appear (select & save settings before).

Installation on MS-DOS:

Run the program PCSLAVE.EXE

1. Select the port with keys <1> = COM1 <2> = COM2
2. Select the speed with the function keys 1->10
300 -> 115200 Baud
Of course, the speed must be the same as the master speed!
3. So, thats all, as long as the slave is active, you'll have
access to it from the master.
4. To quit, press escape (access is terminated).

Use:

Use it the first time at low speed, to avoid speed problems.

The data that is transfered is CRC32 controlled, so when a
datablock send by master or slave has errors, it is send
again (this as much as needed). So, if a computer is to slow,
or in other words the transfer speed is to high, the system

will lock up. In that case hold CONTROL/SHIFT/ALTERNATE on the
master (Atari) and the transfer will stop with an ERROR code.

If on the MS-DOS screen, command tracing is ON, you can watch all
used GEM-DOS operations (very interesting). Here you also can see
the errors. MASTER ERROR means the master recieved a datablock with
checksum error (Master to slow?) and SLAVE ERROR means the slave
received a bad data block (Slave to slow?).

Notes:

What does not work:
- Renaming a folder on the slave. (difficult to do under DOS)
- Starting a program (.PRG of course) on the slave.
(maybe in the next version...)

What's next:
- An Atari Slave program, to connect Atari to Atari
- More ports support (midi, parallell)
(I am really curious to see the parallell speed...)

This is a beta-version, Bitz does not take any responsability
for dammage occured to hard- and/or software by using this program...

If you have any suggestions, bug-reports or whatever, or if you are
interested in a full working version, contact me:

Hmm. Okay, I admit that I've seen him post (seemingly) the same "blurb"
over and over. Let me ask this though, in the interest of rational
discussion, where is an honest-to-goodness Atari vendor supposed to
advertise since the magazines and other outlets are pretty well gone?

I'm not defending him, guys...just an honest question.

Agree here. Magic and Xboot is a no no on CT60. I do use Xboot still, since i like it a lot, but i know 1st hand that with Magic it craps big time. Removing the Xboot did the trick.

Just got an possible solution if u like Xboot (works if Xboot dont mess caches emediately on startup):

Xboot can be configured to exit emediately if u hold certain key. Maybe after initial Xboot session u hold that key during Magic session would avoid those cache probs....

Well, since we're sharing a beer (and you're buying!!), a fair place would
be here, with a short post, infrequently and to the point, but not reams of
the same bollox over and over every few days.

Someone else here managed to get the message and still manages to slip in
the odd unobtrusive advert but only where its relevant!

I use Xboot on an 030 with no problems

Yes there is no probs on 030. On CT60 Xboot seems to mess with CACR and since Magic after bootstraping magic.ram enter boot procedure again (runing xboot again) cause a bus error. Thats is a speculation, but cache is most likely a problem with 060.

Hi!

Another point of view!Perhaps!
Just try to find serial mouse for pc computer!
(it's operationnal with ps/2 sï¿œrial too....)

And after that just install "pcmouse" freeware software"!

Or another possibility too, just try to find special
"hardware" for atari : eiffel.....open source hard&soft!
(of course it's a D.I.Y if you want too)

Only solutions, just keep contact with atari groups.....

Bye

Well,

After you partition the hard drive, you have to reboot. Hddr-util only
shows the partitions that were loaded when hddriver.prg (or .sys if
installed) listed. Most likely you will not be able to interact with
partitions over 1gig under Tos 4.04 very much at all. So the procedure is:

1. Clean system.
2. Run hddriver.prg to detect the disk and whatever partitions may be on
it.
3. Load hddrutil and partition the disk into whatever you find suitable,
noting that partitions over 1 gig will not be accessible under MagiC or
MiNT.
4. Reboot the machine and run hddriver.prg again, this time it will detect
all the partitions you made previously.
5. Run hddrutil and interact with those partitions, probably want to zero
or initialize them.
6. Then you want to install hddriver on the disk. Go to "Ide disks" in
one of the menus and hit "Modify HD-Driver". Then hit install hddriver
from the other menu.
7. Now hit locate hddriver and load the hddriver.sys from C: (most likely
an unnecessary step, I just do this to make sure I am modifying settings
on my hdd
8. Then hit autoconfigure.
9. You're done.. relax.

Thanks,
Mark

How's he going to do that if he can't even get the cursor to move? ;) LOL one thing at a time. As ozk said, use the alt keys + arrow keys to move. Alt insert is left click, also very important. TOS was never setup to be keyboard driven very well.

Thanks,
Mark

Nobody is going to be crazy enough to do that. Best hope is a USB wlan dongle and someone writing a driver, but wlan drivers are insane. They're usually pretty tough to support. Your best bet is an ethernet to wlan bridge. Lp already uses one of those on his TT without troubles.

Thanks,
Mark

> it further.

While I agree with you partially, there's no reason you shouldn't be able to have 300 apps open. I mean we have 256MB+ of RAM now. Most importantly my MagiC probs happen when I do similar stuff to what I do without problems under MiNT and N.Aes. Therefore I have to blame MagiC. And it crashes really weirdly and randomly. Like start the system up, start aniplayer, go back to magxdesk, go to load qed. As soon as you doubleclick qed.. crash.. System angehalten. And MagiC has been this way for all of my machines. Sometimes you boot it up and it runs great for a week, other times it doesn't last 2 minutes. On most of my machines if I boot it up and walk away, I come back it is crashed for me. I leave MiNT running on my Falcon for weeks at a time as a dev system with no crashes. And this is memory protection disabled. I believe the problem is that MagiC or MagiC's AES is over-optimized (it is REALLY FAST). This has all been beaten to death 40 times over and I don't want to dredge anything up, because even MagiC's author, Andreas Kromke said on this NG that stability issues are most likely related to extreme optimizations in MagiC. And it is unfortunate that I can't get things to be stable because it is wicked fast.

Er...I'm confused now. I thought that MINT with HDDriver *could* access
partitions over 1 gig, as long as its a MINT (ext2) partition.

Or did you just mean that greater than 1 gig ---> TOS <--- partitions
can't be accessed?

Thanks!

Oops,

I meant that those partitions would ONLY be accessible under MiNT or MagiC
but would be visible under TOS. If you try to access them, you'll just
get some disk not found error or something. I forget the exact message.

Sorry for the confusion ;-)

TOS 4.04 can handle up to 1GB partitions, it can see 2GB ones as well,
but it don't handle them correctly. Magic can see bigger ones, but i'm not
aware what is the limit. MiNT definately see over 1GB and if i'm not
mistaken, the ext2 limit is 12TB or so....

I have been given a ALLDATA automotive computer, inside is a Atari
1040ST main board.
This computer has one floppy drive on the back and a SCSI cdrom on the
front for which I have many automotive repair discs.
Here is my problem, I turn on the machine and it attempts to read the
cdrom, and floppy drives. times out and then boots to what looks like
an Apple interface, I then have tried to read the original boot disk
that came with the machine, no go, will not format a blank 720k disk
either.
I have opened the machine, blown out with compresed air, unplugged and
plugged back in all cables, and removable chips.
It never had a keyboard, though a phone looking jack is on the front,
it was always used with a mouse.
Most of the machine appears to work but just can't read the drives.
I'd really like to be able to use this machine and would be gratefull
for any help.
Thanks to all that can help.
Douglas

Not hardly. It's the full purchased version and is registered with Uwe.

FYI, AHDI almost does the same thing, but it actually sees all 3 partitions, it just won't write anything to them.

Thanks,

How bigs the HD and partitions ? I never solved my HD issues, but on my falcon I can use a 540MB drive fine (devided into 100MB chunks) but I also have a 1.5gig HD, if I partition this into say 500MB chunks, I can only access the C: partition, D and E just wont work, dispite many conflicting views on this, I can only assume that it will access upto around 500MB of space.

Just a thought. Have you checked the jumper settings on the drive ?
I had similar problems when using two drives on the same IDE cable on
the Hades, and they disappeared once I got that sorted.

I imagine you've just got the one connector on your IDE cable ? So
have you set the drive jumper to master ? (A lot of drives are
supplied jumpered ready for "cable select" these days.)

BTW, I had no difficulty using HD driver to check out an 80GIG drive
on my Hades, running MintNet. It found it, and partitioned it within
about 2 mins. I did it to check the drive as I was having problems
trying to get it running on my PC.

Wayne,

Load up your MagX.inf in a text editor and add a pound sign (#) in from of
the line where it says "slashimage" or something similar. The option will
be pointing to a .img file. This will disable the splash screen
altogether.

Thanks,
Mark

Assuming that this is 6.20 you should find a fully-commented magix.inf
file in one of the sub-folders on your C: drive.

> thanks, I'll try everthing you suggested and report back. Robert,
> Rudolphe and Janez, I had tried running without XBoot, and still had

Write an autoboot.bat text file inside your auto folder listing the
progs you want to run from that folder, in the order that you want them
to run. Otherwise you could try Stoop.

An issue in the past with XBoot was fixed by uncompressing xboot using a
specific uncompressor prog, the name of which escapes me.

Hi, Mark!

MD> TOS was never setup to be keyboard driven very well.

I agree if you talk about keyboard driven menue and dialog control. But I think that none of the "current" main-stream OSes have keyboard support for emulating the mouse cursor. To me this has been a really helpful feature many times.

I think this is related to the ICE compression that some executables
are packed with, which crashes the 060 CPU because of the caches.

Coda.

Same thing on my TT : 2 bombs just before the desktop is displayed, but
all works fine despites this - I mean : the bombs occur, then the
desktop is displayed, and then I can use the computer as if the bombs
weren't there. I had got it fixed once, but I don't remember what I did.

No they don't have it, and yes it is useful but most mainstream systems
have more obvious and consistent keyboard shortcuts.

That's not to say more modern and mainstream AES's don't have these
features cause they do. I especially like Geneva's implementation.

Thanks,
Mark

I bought a 520 STf a few years ago. It came with mouse only...no psu.

Well, I have never done anything with it. But looking on the back, it has three pins that will accept a standard PC powercord. In other words, it LOOKS like I could remove the power cord from my windows machine and plug up the Atari with it. However, that can't be right!?!?!

Before I fry this thing, does anyone know what PSU this computer takes? What would happen if I risked it all and plugged it up? lol

BTW, I only paid $10 so no huge investment lost either way.

Thanks!

Hi all,

This is a piece of news I think might be of interest to most of you
guys:

The legendary graphics application Smurf has been released under GPL!
The original authors from Therapy Seriouz Software have agreed to
share the sources with the Atari community in order to allow the
program to be developed also in the future. Sources will soon be
available for anyone to download, but meanwhile read everything about
the release here:

No, TT and Mega PSU's are different to standard ST ones. voltages are
pretty much standard AT supply, so if you can find a mini AT psu
should be fairly straightforward to wire up to the TT. Main issue is
space, best get exact mesurements before you go shopping.

Also you can get replacement actual TT psu's from Best Electronics but
it will cost.

Don't do that. You would most certainly fry it. You should be able to find
an external P/S for it readily enough.

Best Electronics here in the States, has them, I'm sure. (I almost feel
like I'm advertising for them this morning!). :-)

If the machine is an STF (built in floppy). It has a built-in power supply, and the three-pin connector is
for a standard computer AC power cord. The same as your windows machine, monitor, etc.

Okay. Then I'm assuming its not the original 520ST that had the external
power supply.

It must have an internal power supply which is fine for use with a
standard 3 prong AC cord.

Have fun. :-)

I assumed (dangerous!) that he was referring to the original 520ST which had the external power supply, but it seems apparent now that he has a ST model with the internal variety. So he should be fine.

:-)

5742. TeraDesk 3.41 released

Newsgroup: comp.sys.atari.st
Date: 2004-11-09 19:55:35 UTC
From: vdjole@EUnet.yu
Message-ID: <cmr7blbio1@news.eunet.yu>
Source record: 16237

Version 3.41 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix and code-optimisation release; several non-critical bugs
have been fixed and some optimizations have been made so that program size
has been reduced somewhat. See the history file for details.

Have fun.

If it already has the power socket in the back then it should already
have a PSU. The ST's socket itself is connected right onto the ST's
internal PSU board so you should just be able to plug in a kettle lead
and go. However to be on the safe side open up the machien and take
off the sheilding. If you find under the shielding a chunky square
circuit board sitting on top of the mainboard, that's what passes for
the ST's PSU. Just plug and go. If the socket runs sraight into the
motherboard itself then it would have been one of the few very early
models that needed an external PSU, and you'll have to try and track
one down before you can use the system.

Hi Mark,

I will send my falcon mb to ya once I have the hdd setup. It's driving me crazy and I'm not quitting until I get it done.

BTW, I have Magic 5.x, but I will be getting 6.x for Christmas (at least that's what I asking my family to get :). So tell me, what are the major differences between the 2 or rather, why is 6.x better than 5.x? I'll also be getting Jinnee 2.5, Scripter, and Aniplayer. It all comes together as a package. That's why I want to get the hdd ready!!

Take care!!

STF's AFAIK (I have some) are internal, I know there were some external
though I have never seen any of those, were they ST's ? or some odd early
variation ??

That is why usually people have a secondary email that they never check. I use my hotmail account for stuff I will see spam related stuff in and check it maybe once a week. This email that I use now is legit, excluding the nospam, change the nospam with my name at the bottom, and there is my email. I have many, but never really care if I get spam, it is inevitably going to happen. It is a shame that it was wasted, but oh well, things like that happen. I think of these computer recycling things going on in different cities and just think of all the classic systems just being turned in :(

Hi all,

Does anyone have a working setup of a FTP client which will run on my Falcon
which I can load up on floppy ?

I have STing installed anda FTP server, but no matter what I do I just cant
ge tit to work (it used too)

If someone has a working setup I can try then please let me know! I just
wish to logon to my falcon to copy files to my PC using FTP access, or
anything really as long as I can get the PC and ST to talk to eachother
correctly!

cheers,
Chris

Galen,

Some times when one of the hdds I tried to use didn't function correctly at all, my monitor would wack out.....something about the frequency. Just thought I'd let ya know.

I really don't know Mark, but at some point, AHDI recognzed the hdd, created 4 partitions, and copied shdriver.sys to the c: partition!! So then I booted up with HDDriver, and it worked like a charm!! Go figure!!!

Anywho, as soon as I understand how to properly install Didier's CT60 stuff, I'll be got to go. And once I get the hdd all setup, then I'll probably send the falcon mb to you so you can solder the combel chip.

Boy, what a hurdle this was!! And I still have the re-casing to do as well!!

Have a good day,

5763. Stuck Floppy

Newsgroup: comp.sys.atari.st
Date: 2004-11-10 23:41:11 UTC
From: cstanley@zetnet.co.uk
Message-ID: <4192a716$0$2649$4c56ba96@master.news.zetnet.net>
Source record: 16157

Last night I found my floppy (Atari TT) would not eject, neither via the release botton nor by menu >FILE>EJECT>, which told me it was locked (which is rubbish on Atari).

After inspecting the slot with a torch, I decided to go Holby City style: ie, physical.

Holding the release button down, I grabbed the edge of the floppy with a fine-nosed plyers and pulled firmly. The floppy slid out easily.

The problem was that the sticky label had curled itself back on itself and had obviously stuck to the slot's frame. There were two labels one on another.

Lesson: do not stick a new label over an old one.

Such is my contribution to the world's treasury of knowledge.

Happy 9th November,
Charles.

Yup. GAPFTP is the one I use as well, through EtherNEC/STinG 1.26

GAPFTP is command-line only; it's not graphical in any way, so you need to know how to do real command-line FTP stuff. I don't know if there are graphical front-ends to it or not; I suspect there probably are, but I only use it in command line mode.

No need to bother opening it up. Please do not waste your time! If it is a
520STfm, then it has a built in PS. If is has a PC type power connector it
has a built in PS. Period.

AFAIK Atari never released a Atari 520STf model. Only the Atari 520STfm (ST
plus floppy plus RF Modulator)

Tim

Yup, they did. Floppy and no modulator. The first unit to house a floppy
internally.

This is how they go;

ST
STM
STF
STFM
STE

Are you sure? I am not talking about the 1040STf, I am talking about the
520STf.

Why would they release a 520ST, then a 520STM, then a 520STF then a 520STFM?
Doesn't make sense in that order. They realized the Modulator was needed so
the later 520STs had them installed. By then the newer 520ST came with the
floppy which was after the 520STM, so it would mean they added the M to it

unlike the 1040STf.

Well maybe they released it in Europe, but I am pretty sure here in the US there was never a 520STf.

Tim

Well, the ST and STM were only half the size of a STF/FM. I think it was
just down to design. Have a look at the PCB's and case, it makes more
sense then.
>
> Well maybe they released it in Europe, but I am pretty sure here in the US

Dunno about the US, I am a Kiwi living in Australia;-). All the NZ and
AUS stuff was PAL UK.

Do you mean "ARC" files? Never heard of "AR" files. There are
programs that will de'arc those for the Atari and I believe the PC.

It is funny there is no keyboard. I would think it would need one.
I am assuming the disk the computer is try to boot is an Atari TOS
image disk. Maybe you need a new one...

I've finally prepped my hdd. I had to go with AHDI at first, but I was able to partition a 4 gig hdd, and then hddriver saw the drive and the partititons.

Actually, only 3 partitions are logged. That's something I'll have to look at, but I'm just happy to have three 1 gig partitions!!

The upgrade to the most recent version is only $25, isn't it? A lot
less than the extra cost of using a SCSI drive instead of IDE.

Thanks, you're right. I had a quick read through the documentation
that came with it, and there is mention of the various features.

Mac ROMs from old Mac Plus computers aren't really useful now, and I
have no need for 5.25" disk drives connected to the device.
The only useful thing left is the clock option, but since I've already
got an internal clock in my machine I don't need that either. Any
features I've missed which might come in handy?

What's your name ? I have no Galen in my CT60 user list and I need to check some infos about your CT60...

What is the model of your HDD and the driver you use (version number please !) ?

Many mb have problems with CT60 because of a bad clock patch on U63 !
How is yours ?? A photo ? 4 wires or less ???? 74Fxx or 74LSxx 04 or 08 at the end ??

I think you should remove the 74xxx and follow the fitting manual to add the three 33 ohms SMT res and the 47 ohm THT res.

Regards

Looking good! But how about a photo of the whole machine from the
outside as well?

> check out my web site www.atari-korps.co.uk and select Falcon MK X .....
> let me know what you think........

Nice, modern, clean design of your website!
Several mixups though, like if I press the "Mega STe" link it says:

Produced by C-LAB in 1995 this was the last commercial release
of the Atari Falcon.

You must have a different Mega STe from mine ;-)))
The same goes with a lot of the other links ("Mega ST" to mention one).

I see that you've got some references to C-Lab software/hardware.... how
about adding my website to your list of links? The Notator/Creator SL
user mailing list (http://www.notator.org)
(you and everybody else are of course welcome to join!)

Sure, I'll help both of you out as I have versions 1.7, 2.01 and the
2.05 update (which is the latest and final version as far as I know).

I have no problems sharing these files since you need an original dongle
(LOG-3) in order to use them.
But where should I upload them? Any Atari FTP sites which could store
them for anyone to access later on as well?
In the meantime I'll ZIP compress them to make everything ready.

It's been a while, but I just realized that I have an FTP site myself
with loads of Atari ST MIDI software already, so I've just uploaded
everything there. Enjoy!

ftp://gem.win.co.nz/hall/midi/sequencer/logic/

You'll find the following in that directory:

- Logic 1.7 (the complete Emagic Logic 1.7 Atari ST package)

- Logic 2.01 (the complete Emagic Logic 2.01 Atari ST package and
Notator SL 3.21)

- Logic 2.5 update (update package which brings Logic to the final
version 2.5. You need a previous version of Logic
to make it complete. I suggest version 2.01)

- Logic extras (stuff for Logic that I downloaded from the Emagic
website several years ago. Probably long gone by now).

PS: The LOG-3 hardware that comes with Logic actually supports Notator
SL as well (ONLY the final version; 3.21). Actually Notator SL came on
one of the floppy disks in the Logic 2.01 package.

NEVER use a Notator SL (or Creator SL) dongle together with the LOG-3.
The LOG-3 has that dongle built in, and using both at the same time will
most likely damage some/all of your Emagic and/or Atari ST hardware.

... while you're there, also have a look around the rest of the FTP site
for other MIDI software.
A web interface with more details surrounding the files is available
here: http://atari.nvg.org/launchpad/pages/midi.html
(go to the "Downloadable MIDI software" section).

hey it worked! lol

however, you have to hold the cord up a little bit for it to kick in...and sometimes the cord will drop slightly and the system powers off....something is loose. :-/

From: cbmeeks <"cbm at s i g n a l d e v d o t k o m">
Message-ID: <10p9fiv5kshav34@corp.supernews.com>
Source record: 16198

My 520 STFM is really yellowed...except for the keys...they are perfect!

I was told that the Krylon Fusion is the best stuff for plastic but they don't appear to have many colors....I couldn't find anything close to the same color.

So, I might paint it something weird like hunter green or satin black (don't like gloss).

any suggestions?

thanks
cb

> with my Hades060 use aFTP. What are you doing and what exacty
> happens when you try?

Like I said, It was working a while ago so I know how to set the thing up no
problems....

i'm using WSFTP on my PC, and a FTP server program on my falcon...

bascially on the PC I get error 550 which I think is access denied..... The
falcon records the login attempts so they are talking to each other, the FTP
client on the PC (WSFTP) comes up with like "atari FTP client version 1.09"
or something like that....

its just like the passwords or usernames are wrong, but ive been messing
around with it and it just refuses to work.

Tried turning off XP firewell, allowing the IP addresses etc etc, the mand
thing is, when it was working , all I did was reinstall XP, setup the IP
addresses on the PC again, and it never worked since, its like the FTP
server program on the atari is to blame, though these settings were never
altered... I think its a bug in the FTP server myself......

Chris

I have the same problem on my falcon, just wrap some insulation tape around
the power cord, it will make it a bit larger and it wont fall out then...

Hey,

I'm almost positive the Nova VME can ONLY be used with a Mach32 or 64 ISA
video card from PC. IN FACT, the GAL's must be replaced or reprogrammed
when switching between Mach32 and Mach64. I know because I have a set of
Mach32 GAL's in addition to the Mach64 ones installed in my TT. So...
Whatever you do, be careful, and do yourself a favor and get the right
video card. If you need additional setup help, let me know, but it's
easy as pie once you have the right video card.

Thanks,
Mark

Its not matter of size. SM124 is smaller, i agree, SM146 is bigger. Point is that REAL mono monitors have different "glowing" material which also is not needed to be assembled from 3 parts. Result is (im speaking for B/W models) more stable and contrast image. Less headache problems, less eye problems, etc on mono monitors. Very friendly for close staring at monitor. THE problem with SM124 is size however, i agree. I do have VGA/STmono converter and i prefer mono screen, but i do have SM146 which is bigger as SM124.

I would also take a look at the solder connections on the power supply for the cord connector. One might be cracked. If that is not the case, try a different cord. I have had several--even brand new-- cords that do not lock in tight on some machines.

Good luck,
Richard

OOps thought it was a Falcon adapter. Thought it took more than a cable to
connect an ST to VGA. Keeping the black band certainly reduces the advantage
of a bigger screen. Used to love the ST mono monitor but as I get older it
gets smaller. ;^)

5819. WTB: ATARI FALCON

Newsgroup: comp.sys.atari.st
Date: 2004-11-13 04:21:00 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <HWfld.20245$z3.17495@bignews5.bellsouth.net>
Source record: 16114

Looking for an Atari Falcon. Must be in excellent working condition with
TOS 4.04 and internal HD.

Will consider upgraded Falcons, but I need one that is fairly stock.

Also could use a FPU or 2 for some Falcons I have here.

And looking for Atari Falcon Keyboard, MegaST, and MegaSTE Keyboards in
good working condition,
must be very clean.

Always interested in Atari Falcon Hardware and Software if anyone has
some items they want to part with.

If ya have any of the above for sale or to give away 8-) e-mail me a
list of what ya have with what ya need for it at:

phantomm@bellsouth.net

I will reply to any offers made.

I'm in the USA, so Canada and US stuff would be easier for me to get.
However, I have bought Atari items from overseas before
so you folks across the big waters feel free to contact me.

Thanks,
Phantom

*A Personal Message to DON S. Not sure if ya got my e-mail, if not I
would be interested in the Falcon if ya still
have it. If not, no hard feelings. 8-) And I apologize for my
disappearance.

John,

Are you just missing the plastic key caps or do you need the entire
key mechanism? The MegaST keyboard is easily repairable in most
cases. I still have most of the keycaps in my leftovoer parts kit
from Computer STudio. Let me know exactly what you need and
I'll see if I still have those parts.

Sheldon

I managed to work out the manual enought o get the auto folder file order and have arranged all files so they are in order, and that all the files from the AUTO and DATA-TT folders on disk were present along with a CPX that allows some kind of config options. However still no joy. When booting a screen with coloured block (corrrupted letters maybe?) and 2 bombs appears, this can be cleared by pressing a key that brings up an auto program that has several menu options, one which allows you to select a screen resolution and colour depth. Which ever option I select ultimately does ntohign and the machine boots as normal giving normal TT resolutions on the orginal VGA port. I can't get any signal at all through the graphics card VGA port. The CPX untility just says "graphics card not installed!" (in german) but I've disconnectred and reconnected it to the VME several times and it's definitely connected up correctly.

Did you read my response?

I'm almost 100% sure an ET4000 card will not work with the Nova board.
nova's drivers are explicitly for Mach32 or Mach64. Aka Nova, and
SuperNova. In fact, you very well could have fried the GAL's on your VME
board if the ET4000 doesn't play nicely with the wiring arrangement.

The NOVA is NOT A UNIVERSAL ISA ADAPTER! It is a specifically tailored
solution to a single type of video card. ATI Mach32 or 64. Same with
EtherNEC. Just because I have an ISA slot hanging off my ROM port doesn't
mean I can put a video card on it and have it work!

Now I COULD be wrong here. But everything I have EVER READ about the Nova
suggests that I am right. Oh yeah, and I have one!

If this is a Windows 95 question, the answer is probably yes. There is such a thing as a Microsoft Boot Sector Standard, followed by nearly everyone but Microsoft, except for Windows 95. This standard calls for a machine to read the disk boot sector, to find out what it is, and read it accordingly. I did not specifically try it with an SF-354, but that should be read in the same manner. The boot sector would say it was single sided.

This was done for the last floppy disk distribution of Windows, and they could save a disk by formatting to 20 sectors and 80 tracks.

I made use of this so I could sometimes work at home, saving time and gas money, and bring in the disk from my TT the next day, to read on a Windows 95 machine. What I brought in was whatever I had around, and they were not all formatted the same.

For Atari, the boot sector is read into a 2k buffer. Presume that Windows 95 works this way too. This, I believe, is part of that Microsoft Boot Sector Standard.

Jim

Hi Mark!

MD>I'm almost 100% sure an ET4000 card will not work with the Nova board.
MD>In fact, you very well could have fried the GAL's on your VME board if
MD>the ET4000 doesn't play nicely with the wiring arrangement.

I'm almost sure you are wrong :-)

I've got a nova Falcon, which is designed to work with a mach64. At the time I purchased it, I wasn't able to locate the appropriate graphics card. Therefore, I tried to use some ET4000 together with NVDI5. I did in fact get a picture on the screen, and could alter the resolution with the video mode editor also, but wasn't able to switch the pixel clock to anything else but the default 640x480@60Hz setting. Thus, I couldn't really use the ET4000 on the Nova, but it didn't do any harm either.

With best regards
Ekkehard

5838. trying to run STinG from a floppy

Newsgroup: comp.sys.atari.st
Date: 2004-11-14 09:13:27 UTC
From: mrrik@hay.am
Message-ID: <88f41e4b.0411140113.38fd125f@posting.google.com>
Source record: 16132

Hello.
I have nor hard drive, so I try to run STinG from a floppy.
The reason, I want to try use telnet programs to access the net.
On a floppy I have created three folders:
Auto, dialer, and sting.
In Auto folder there is two files:
sting.prg
sting.inf
Sting.inf contains only single line:
A:\STING\

In a sting folder:
cache.dns default.cfg masque.sty route.tab udp.stx
cen_plep.sty ether.sty midi.sty serial.stx update.txt
cen_plip.sty lcltlk.sty resolve.stx tcp.stx

In a dialer folder:
call_it dial.inf dial.scr icon.rsc local.fee rem_ctrl
dialer.app dial.rsc docs isp_scr login.bat

dial.scr contains:
<quote>

```
#
# VAR = VALUE : standard format
#
# Lines beginning with '#' or any nonprintable character are
ignored.
# They don't even consume any memory.
#
# The variable names are not case sensitive.
# Values may be case sensitive depending on usage. Watch out for
# unintentional blanks at the end of a string value.
#
# Some variables may be specified twice or more often (like the
# PHONE_NUMBER).
#
#
#
# Configuration part of script file
#
#
# This variable determines if the Dialer terminates after the last
# window has been closed. If set to zero, the Dialer terminates
# automagically after the user closed all windows. Set to one, the
```

```
# variable causes the Dialer to stay in an event loop, waiting for
# AC_OPEN or dialing request messages. AC_OPEN causes the Dialer to
# reopen the main window.
#
RESIDENT = TRUE
#

LAN_PORT = FALSE
#
#
# Your username and hostname.
#
# HOSTNAME is the hostname of your computer for this session. If
# your address is dynamically allocated, HOSTNAME will be wrong.
# For now, just set it to your providers hostname (or whatever).
# Try to make it reasonably accurate if possible.#
# USERNAME doesn't make much sense either until I have an identd
# working. So it doesn't really matter what it is. When I do have
# an identd, this will be your `valid' username for incoming
queries.
#
```

```
# FULLNAME is pretty obvious, right ?
#
USERNAME = ru
HOSTNAME = ru.ppp.freenet.am
FULLNAME = Peter Rottengatter
#
#
# State here which IP address you're gonna use. If you got a
permanent
# address from your ISP, put it in here. If you get a new address
each
# time you log in, then use 0.0.0.0 here (this is irrelevant for
SLIP,
# but essential for PPP !)
#
CLIENT_IP = 0.0.0.0
#
#
# Your ISP probably imposes a limit to the size of IP packets
# (Maximum Transfer Unit). Many ISPs use the standard Ethernet
# MTU of 1500 bytes. 576 is safe in any case, however.
#
MTU = 576
#
#
# If you want to use IP masquerading to hook your LAN to the
Internet
# while your ISP provides only one IP address, set this variable to
# TRUE. Better don't touch it if you never heard of masquerading
before.
#
MASQUERADE = FALSE;
#
#
# The NAMESERVER (ie: DNS or Domain Name Server) *must* be set,
# preferably to a nameserver that your provider recommends. Note :
# The address must be a dotted quad, that is, four decimal numbers
# separated by dots. The mnemonic name will not work, as again a
# name server would be needed to resolve it. Put IP addresses of
# all up to five name servers here, just preparing for the case your
# favourite name server is down. Note PPP can fetch the name server
# addresses automagically, if your ISP allows this. Still for SLIP
# the name servers *must* be specified *here* (remove the '#').
#NAMESERVER = 130.75.1.32
#NAMESERVER = 130.75.1.40
#
#
# Port of your computer to be used for the modem connection.

# Port parameters to be used for the login stage. 8N1 is used
# normally, but CompuServe requires 7E1. Setting CIX_LOGIN to
# TRUE causes the Dialer to log in using 7E1.
#
CIX_LOGIN = FALSE
#
#
# Phone Number(s). PHONE_NUMBER = number. Some providers
# have more than one number you can dial. You can specify
# up to eight phone numbers here. Specify none if you use a#
leased line.
#
PHONE_NUMBER = 592000
#
#
# File describing the telephone fee structure of your telephone
# company. The file must be in the same directory as this script
# file.
#
FEE_FILE = LOCAL.FEE
#
#
# These parameters describe what the ISP charges for Internet
# access. Some ISP charge for time only, some for transferred
# data, some for a combination of both. Some even discriminate
# between sent and received data.
#
# Each entry consists of the unit (of time, or data), and the
# corresponding cost. The unit may be followed by an 's', 'm' or
# 'h' for seconds, minutes and hours in case of time, or 'K' or
# 'M' for KBytes (1024 bytes) and MBytes (1048576 bytes) in case
# of transferred data. The cost unit (Dollar '$', Deutsche Mark
# 'DM') is specified in FEE_FILE.
#
ISP_TIME = 72s, 0.07
ISP_SENT = 12K, 0.03
ISP_RECVD = 84K, 0.09
#
#
# Set this to TRUE if you have only one machine to be connected
# to the Internet. You need every IP packet to be sent to the
# ISP's host, thus a default route should be created. Setting this
# to TRUE causes the Dialer to do this.
#
DEF_ROUTE = TRUE
```

```
#
#
# If this is set to TRUE, the file specified by the LOGIN_BATCH
# variable (set either in DEFAULT.CFG or the network environment)
# is treated as a batch file and executed after login. The file
# contains lines that specify a binary (complete path) and a
# set of commandline parameters, all separated by spaces.
#
EXEC_BATCH = FALSE
#
#
# Setting this variable to TRUE causes the Dialer to write debug
# info about the connection initialization to disk.
#
DEBUGGING = FALSE
#
#
#
# Connection part of script file
#
#
# This part is initialising the modem, dialing a remote system
# and establishing a connection to a remote modem.
#
# INIT sets the string you can use to initialise the modem.
#
INIT = ATZ
#
#
# PREFIX sets the dial prefix (ie: ATD, ATDT, ATDP, whatever else
# is needed to get a dial tone)
# is needed to get a dial tone)
#
PREFIX = ATDT
#
#
# Then you should define how to hangup your modem, i.e. which
# command is to be used to shut down a connection. The dialer
# will use the DTR signal to hangup the modem if HANGUP = DTR is
# set. Otherwise set HANGUP to the appropriate hangup string
# for your modem. A comma forces the dialer to wait a second.
# Normally a pause, three '+' characters and another pause cause
# a modem to revert to command mode, then 'ATH' can be issued.
#
HANGUP = ,+++,ATH
#
#
# The dialing parameters are CONNECT_WAIT and REDIAL_DELAY. These
# are times in seconds. CONNECT_WAIT is the amount of time to wait
# for a connection after dialing a number. REDIAL_DELAY is the
```

```
amount
# of time to wait in between dial attempts.
#
CONNECT_WAIT = 60
REDIAL_DELAY = 20
#
#
# Connection success can be determined either by detecting the
# modems Carrier Detect signal (SUCCESS = CDWAIT), or waiting
# for a CONNECT response (SUCCESS = CONNECT) from the modem.
# Failure can be determined by a timeout or a modem response
# such as NO CARRIER or BUSY. NO DIALTONE generally means a
# serious problem like the modem not being connected to the
# telephone line, so that an immediate redial is not a sensible
# reaction. The dialer will be halted instead. Up to three
# test words of each kind can be set.
#
# The SUCCESS = DIRECT has a special meaning. If specified, the
# dialer will skip the dialing part, moving on to the script
# execution straight away. This is handy for doing connects on
# serial lines connected directly to a host (without modem), or
# on leased lines.
#
# Make sure your modem is configured correctly in order to get
# the connection speed shown in the dialing window. It's also
# advisable to use only one SUCCESS string (the one after which
# the modem sends the connection speed).
#
SUCCESS = CARRIER
SUCCESS = CONNECT
SUCCESS = CDWAIT
FAILURE = BUSY
FAILURE = NO CARRIER
ABORT = NO DIALTONE
#
#
#
# Login part of script file
#
#
# This part is to log into the remote computer. This will probably
# involve entering a username and password, selecting SLIP mode,
# and reading the Internet Address that your system will have for
# the duration of the session.
#
# This variable determines how many seconds the script interpreter
# will wait for the FIND strings to be received. If the FIND times
# out, script execution will be aborted and a hangup and redial will
# be initiated.
#
```

```
FIND_TIMEOUT = 60
#
#
# The beginning of the script part is denoted by the DIAL_SCRIPT
# keyword.
#
DIAL_SCRIPT
#
#
# The STinG dialer uses the standard `conversational' method for
# login to the provider. This involves searching for certain
# words and sending an appropriate response. The special
# response $GET_IP is used to read the IP address that your
# provider has assigned you for this session. If your provider
# has allocated you a permanent IP Address, then you should set
# it using the CLIENT_IP keyword (see above) and NOT use $GET_IP.
#
# Each step of the `conversation' is specified as a FIND line,
# a REPT line, a WAIT line, and a RESP line. There can be up to
# 32 steps. Each FIND *must* have a matching REPT, RESP and WAIT,
# even if they have no value. This is because values are put into
# arrays in the order they appear.
#
# WAIT is the time in milliseconds to pause before each
REPT/FIND/RESP
# For accuracy, the time should be a multiple of 5 (i.e.: a WAIT = 4
# would result in a pause of 0. WAIT = 12 would be 10).
#
# REPT specifies a string that is sent repeatedly while searching
# for the FIND string. Particularly older systems might require
# initial CRs sent, in order to trigger the login.
#
# By default each RESP line is sent with a carriage return
# character at the end. If you need to use a line feed character
# instead then put a | at the end of the line, or a \ in order to
# use an ESC character. This only works if the | or \ is the last
# character of the line. A / character at the end of a line means
# carriage return, but this is the default, so you don't need it.
#
# If you want to send just a Carriage Return, then use RESP = /
# If you want to send just a Linefeed, then use RESP = |
# If you want to send just a ESC, then use RESP = \
#
# Note that if neither REPT, FIND or RESP have a value, they are
# Note that if neither REPT, FIND or RESP have a value, they are
# ignored, but in this case the WAIT (if any) will still pause.
# If FIND has no value but RESP does, the value of RESP will be
# sent immediately after the WAIT time. No REPT string will be
# sent in that case. If FIND has a value but RESP does not, then
# after the FIND the REPT repetition will cease and the dialer will
```

```
# move straight on to the next WAIT / REPT / FIND / RESP.
#
# Here is an example. Note most ISPs allow to not use any script
# at all if using PPP (PAP-ID and PAP-Password - see above - are
# used for authentication then). Therefore this example script
# is disabled. To put it to work, just remove the comments ('#')
# in front of the lines.
#
#WAIT = 500
#REPT = /
#FIND = Username:
#RESP = YourUsernameHere
#
#WAIT = 500
#REPT =
#FIND = Password:
#RESP = YourPasswordHere
# in front of the lines.
#
#WAIT = 500
#REPT = /
#FIND = Username:
#RESP = YourUsernameHere
#
#WAIT = 500
#REPT =
#FIND = Password:
#RESP = YourPasswordHere
#
#WAIT = 500
#REPT =
#FIND = prompt
#RESP = slip
#
#WAIT = 500
#REPT =
#FIND = Your IP address is
#RESP = $GET_IP
```

</quote>

If You want to review my configuration, You can download sting folders
and configs created by me from http://freenet.am/~ru/atari.zip

dial.inf contains:
A:\DIALER\

When I put floppy into the drive and start Atari it starts sting, then
show messages about loading serial, tcp, udp modules.... and more...
Then when I start dialer.app it make messagebox where written that
serial module not loaded.

What can I do???
Sting version126

Thank You very much!

Join cix/classified/5wanted and post an ad? The Fujitsu MAT whatever it
is 2G laptop drive worked a treat in my Falcon.

> How do I get it boot up from an external drive?

As a replacement for the internal IDE? Just install a hard disk driver
on it; HDDriver for preference or AHDI if you want a free alternative.

In the end they were, probably because it was hard to find the correct
ISA-cards. I bought my Nova without the video card, that was in 1997 IIRC.

You can use virtually any IDE drive, but unless you use MiNT or MagiC (and
I believe you need HD-Driver as well) you can only use the first 2Gb.

> How do I get it boot up from an external drive?

By installing the harddisk driver on the external drive and removing it
from the internal drive.

Of course, it still existe solutions!
Eclipse work with ct60!
Of course, the eclipse is under ct60!
(because it dï¿œpend of bus speed!)
Just mail to Zorro, the author of "zview",
he use exactly this option.....

Yes, the version I have is for the standard 1mb ET4000 board. I did
check that before I brought, as I already had the ET4000 graphics card
and didn't want to get a new card.

Not sure how to help you then, because the ET4000 version is probably a
bit different than the one I have. I mean I didn't even know it existed ;-)

I don't know how you use AHDI, HDDriver is easy-peasy.

5850. Re: trying to run STinG from a floppy

Newsgroup: comp.sys.atari.st
Date: 2004-11-14 19:25:33 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <cn8bfd$68n$1@reader1.panix.com>
Source record: 16144

Someone has already mentioned that you lack a CPX. Serial.cpx, in
particular, and the control.acc file.

There is, with sting, a log file program. That can be used to find out
where things go wrong. One thing I noticed is that your config file
will not work with a dialup that serves more than one ISP. For that
purpose, you are not me, but me@isp.com, or .net, as applicable.

Jim

norik <mrrik@hay.am> writes:

: Hello.
: I have nor hard drive, so I try to run STinG from a floppy.
: The reason, I want to try use telnet programs to access the net.
: On a floppy I have created three folders:
: Auto, dialer, and sting.
: In Auto folder there is two files:
: sting.prg
: sting.inf
: Sting.inf contains only single line:
: A:\STING\

: In a sting folder:

: leased line.
: #
: PHONE_NUMBER = 592000
: #
: #
: # File describing the telephone fee structure of your telephone
: # company. The file must be in the same directory as this script
: # file.
: #
: FEE_FILE = LOCAL.FEE
: #
: #
: # These parameters describe what the ISP charges for Internet
: # access. Some ISP charge for time only, some for transferred
: # data, some for a combination of both. Some even discriminate
: # between sent and received data.
: #
: # Each entry consists of the unit (of time, or data), and the
: # corresponding cost. The unit may be followed by an 's', 'm' or
: # 'h' for seconds, minutes and hours in case of time, or 'K' or
: # 'M' for KBytes (1024 bytes) and MBytes (1048576 bytes) in case
: # of transferred data. The cost unit (Dollar '$', Deutsche Mark
: # 'DM') is specified in FEE_FILE.
: #
: ISP_TIME = 72s, 0.07
```

```
: ISP_SENT = 12K, 0.03
: ISP_RECVD = 84K, 0.09
: #
: #
: # Set this to TRUE if you have only one machine to be connected
: # to the Internet. You need every IP packet to be sent to the
: # ISP's host, thus a default route should be created. Setting this
: # to TRUE causes the Dialer to do this.
: #
: DEF_ROUTE = TRUE
: #
: #
: # If this is set to TRUE, the file specified by the LOGIN_BATCH
: # variable (set either in DEFAULT.CFG or the network environment)
: # is treated as a batch file and executed after login. The file
: # contains lines that specify a binary (complete path) and a
: # set of commandline parameters, all separated by spaces.
: #
: EXEC_BATCH = FALSE
: #
: #
: # Setting this variable to TRUE causes the Dialer to write debug
: # info about the connection initialization to disk.
: #
: DEBUGGING = FALSE
: #
: #
: #
: # Connection part of script file
: #
: #
: # This part is initialising the modem, dialing a remote system
: # and establishing a connection to a remote modem.
: #
: # INIT sets the string you can use to initialise the modem.
: #
: INIT = ATZ
: #
: #
: # PREFIX sets the dial prefix (ie: ATD, ATDT, ATDP, whatever else
: # is needed to get a dial tone)
: # is needed to get a dial tone)
: #
: PREFIX = ATDT
: #
: #
: # Then you should define how to hangup your modem, i.e. which
: # command is to be used to shut down a connection. The dialer
: # will use the DTR signal to hangup the modem if HANGUP = DTR is
: # set. Otherwise set HANGUP to the appropriate hangup string
```

```
: # for your modem. A comma forces the dialer to wait a second.
: # Normally a pause, three '+' characters and another pause cause
: # a modem to revert to command mode, then 'ATH' can be issued.
: #
: HANGUP = ,+++,ATH
: #
: #
: # The dialing parameters are CONNECT_WAIT and REDIAL_DELAY. These
: # are times in seconds. CONNECT_WAIT is the amount of time to wait
: # for a connection after dialing a number. REDIAL_DELAY is the
: amount
: # of time to wait in between dial attempts.
: #
: CONNECT_WAIT = 60
: REDIAL_DELAY = 20
: #
: #
: # Connection success can be determined either by detecting the
: # modems Carrier Detect signal (SUCCESS = CDWAIT), or waiting
: # for a CONNECT response (SUCCESS = CONNECT) from the modem.
: # Failure can be determined by a timeout or a modem response
: # such as NO CARRIER or BUSY. NO DIALTONE generally means a
: # serious problem like the modem not being connected to the
: # telephone line, so that an immediate redial is not a sensible
: # reaction. The dialer will be halted instead. Up to three
: # test words of each kind can be set.
: #
: # The SUCCESS = DIRECT has a special meaning. If specified, the
: # dialer will skip the dialing part, moving on to the script
: # execution straight away. This is handy for doing connects on
: # serial lines connected directly to a host (without modem), or
: # on leased lines.
: #
: # Make sure your modem is configured correctly in order to get
: # the connection speed shown in the dialing window. It's also
: # advisable to use only one SUCCESS string (the one after which
: # the modem sends the connection speed).
: #
: SUCCESS = CARRIER
: SUCCESS = CONNECT
: SUCCESS = CDWAIT
: FAILURE = BUSY
: FAILURE = NO CARRIER
: ABORT = NO DIALTONE
: #
: #
: #
: # Login part of script file
: #
: #
```

```
: # This part is to log into the remote computer. This will probably
: # involve entering a username and password, selecting SLIP mode,
: # and reading the Internet Address that your system will have for
: # the duration of the session.
: #
: # This variable determines how many seconds the script interpreter
: # will wait for the FIND strings to be received. If the FIND times
: # out, script execution will be aborted and a hangup and redial will
: # be initiated.
: #
: FIND_TIMEOUT = 60
: #
: #
: # The beginning of the script part is denoted by the DIAL_SCRIPT
: # keyword.
: #
: DIAL_SCRIPT
: #
: #
: # The STinG dialer uses the standard `conversational' method for
: # login to the provider. This involves searching for certain
: # words and sending an appropriate response. The special
: # response $GET_IP is used to read the IP address that your
: # provider has assigned you for this session. If your provider
: # has allocated you a permanent IP Address, then you should set
: # it using the CLIENT_IP keyword (see above) and NOT use $GET_IP.
: #
: # Each step of the `conversation' is specified as a FIND line,
: # a REPT line, a WAIT line, and a RESP line. There can be up to
: # 32 steps. Each FIND *must* have a matching REPT, RESP and WAIT,
: # even if they have no value. This is because values are put into
: # arrays in the order they appear.
: #
: # WAIT is the time in milliseconds to pause before each
: REPT/FIND/RESP
: # For accuracy, the time should be a multiple of 5 (i.e.: a WAIT = 4
: # would result in a pause of 0. WAIT = 12 would be 10).
: #
: # REPT specifies a string that is sent repeatedly while searching
: # for the FIND string. Particularly older systems might require
: # initial CRs sent, in order to trigger the login.
: #
: # By default each RESP line is sent with a carriage return
: # character at the end. If you need to use a line feed character
: # instead then put a | at the end of the line, or a \ in order to
: # use an ESC character. This only works if the | or \ is the last
: # character of the line. A / character at the end of a line means
: # carriage return, but this is the default, so you don't need it.
: #
: # If you want to send just a Carriage Return, then use RESP = /
```

```
: # If you want to send just a Linefeed, then use RESP = |
: # If you want to send just a ESC, then use RESP = \
: #
: # Note that if neither REPT, FIND or RESP have a value, they are
: # Note that if neither REPT, FIND or RESP have a value, they are
: # ignored, but in this case the WAIT (if any) will still pause.
: # If FIND has no value but RESP does, the value of RESP will be
: # sent immediately after the WAIT time. No REPT string will be
: # sent in that case. If FIND has a value but RESP does not, then
: # after the FIND the REPT repetition will cease and the dialer will
: # move straight on to the next WAIT / REPT / FIND / RESP.
: #
: # Here is an example. Note most ISPs allow to not use any script
: # at all if using PPP (PAP-ID and PAP-Password - see above - are
: # used for authentication then). Therefore this example script
: # is disabled. To put it to work, just remove the comments ('#')
: # in front of the lines.
: #
: #WAIT = 500
: #REPT = /
: #FIND = Username:
: #RESP = YourUsernameHere
: #
: #WAIT = 500
: #REPT =
: #FIND = Password:
: #RESP = YourPasswordHere
: # in front of the lines.
: #
: #WAIT = 500
: #REPT = /
: #FIND = Username:
: #RESP = YourUsernameHere
: #
: #WAIT = 500
: #REPT =
: #FIND = Password:
: #RESP = YourPasswordHere
: #
: #WAIT = 500
: #REPT =
: #FIND = prompt
: #RESP = slip
: #
: #WAIT = 500
: #REPT =
: #FIND = Your IP address is
: #RESP = $GET_IP

: </quote>

5851. Centronix C-50 pinout?

Newsgroup: comp.sys.atari.st
Date: 2004-11-14 19:32:38 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <cn8bsm$68n$2@reader1.panix.com>
Source record: 16145

I have a small problem. I have a bunch of new, used drives that do not have a jumper to set for bus power, so I have an unpowered bus which does not work. My TT does have pin 25 not connected, but connecting it will do nothing because both the DB-25 to C-50 cables I own have no connection from the DB-25 end on pin 25.

One convenient place to supply bus power is in an external box, of which I have several. These places have a C-50 external connector, and 50-way ribbon cable leading to a 50-pin end of an appropriate adapter for the drive I have.

Does anyone have, or can anyone tell me where I have not looked, for pinouts of either the C-50 connector, or the signal names of a 50 pin drive connector? I need to find a place to put bus power into the bus, for modern drives that no longer do that.

Yes, I have tried to trace the cables I have, but that does not give me the information I need.

Thanks in advance

Jim

Sorry Jo, this isnt correct. I have a 10gb IDE on my falcon, setup as
10x 1gb partitions, and every partition works fine under Single TOS
4.04 (except for 1 partition that is EXT2).

Coda.

I also heard that the Eclipse drivers dont work with the CT60.
Can anyone confirm this?

Coda.

It's been a while since I talked to any of the (don't actually
remember if it was only one or 2-3) CT60+Eclipse owners, so I can't
say anything 100% definite on how it's working out for them.
(Well, I own both a CT60 and an Eclipse myself, of course, but the
Eclipse is still in my AB040 machine.)

>I also heard that the Eclipse drivers dont work with the CT60.
>Can anyone confirm this?

AFAICR, the fVDI driver itself is 100% OK. Otherwise it would be
impossible to use the Eclipse with the CT60. There's really no reason
why there should be a problem with that.

However, the Eclipse PCI BIOS still only works on the '030 or
together with a specially modified version of the AB040 Toolkit.
This means that the functionality you can currently get from the
Eclipse/RageII on a CT60 machine is somewhat limited.
(The Eclipse only provides a small physical memory "window" to the
PCI bus, so the PCI BIOS uses the MMU to dynamically remap this
window when different areas of the PCI memory space is accessed.)

IIRC, the only things that doesn't work is screen -> RAM blitting.
(All other things are done via fixed memory addresses close to
eachother, which don't require any window remapping. But the frame
buffer itself is far too large for the only window.)

This may sound really bad, but thanks to the way the RageII driver
can be told to optimize such blits (most of them, by far, are used
to store menu backgrounds etc) by only blitting to an off screen space
on the graphics card, you'd not notice anything with most software.

In fact, that optimization is the recommended setting even if you
are running with the PCI BIOS, since it makes important things (like
menu drawing) much quicker, and only a small handful of programs (that
I've heard about) has problems with it.
(To run into trouble, you either have to actually use the data you
blit from the screen for something, or blit it back again in the wrong
order.)

Hi All,

I have a few ethernec's for sale.

Ethernec interface w/network card: $50
Configured ISA Network card: $19
Suitable Enclosure $15 un-modified, $19 modified.

Payment can be made with Paypal (add 4%) or snail mail. Cost of
shipping will be added to order. Address is as follows.

Rory McMahon
831 Gee Court
Elburn, IL 60119
USA

Paypal: fujiman@netzero.net

Thanks
Rory

Hallvard

I've recently bought a copy of Cubase Score, and want to use it with my ST set-up for mixer maps etc. I currently have a UnitorN and a Unitor2, as well as LOG-3. I use the 'N' in one ST and the 2 in the other (along with the LOG-3). What I'd like to know is - can I use the Cubase dongle with the Unitor2 and LOG-3, or will the same hardware clash/damage be likely to result?

Thanks

JD

Many thanks for sharing the ftp site...

Wow...Logic is going to take some practice.....

Is there a Logic Audio Falcon? I recall reading somewhere it was
released in various alpha and beta stages but never really 'sold' as a
solid product.
Just courious.

Brian

I really have no idea, but I suppose it wouldn't cause any problems as
it has nothing to do with Logic or Notator SL.
I don't know specifically why you can't insert a Notator SL dongle into
the LOG-3, but it's probably something to do with having much of the
same copy-protection circuitry which'll cause conflicts, but I'm really
just guessing here.

The warning comes in the readme file on the Logic disks and there's no
mention of cartridges/dongles in general. I've actually got a "Combiner"
myself (http://www.notator.org/html/notator_faq.html#combiner) which I'm
currently using with an "X-alyzer" (DX-7 editor) dongle. I've also used
it with an Korg M-3 editor dongle as well as a "Polyframe" dongle. Had
no problems.

If I were you I'd try to find a Cubase discussion forum and ask there.
I'm sure there are Cubase-Atari users somewhere to be found, seeing that
my mailing list for Notator/Creator SL users (http://www.notator.org)
has over 150 members.

Hello, Rory

Many thanks. The very first one produced exactly what I was looking
for. I will write these addresses in my little orange (not black)
book, so I will never have to ask again. As far as I can tell, Google
does not like me, or at least did not place these sites in any
low-numbered page where I looked for them.

And, when I looked again for cs-electronics, who have adapters
needed for putting a SCA drive on the end of a 50-pin cable, google did
not find it, or I did not properly tell it where to look.

Maybe it can outthink me, but sometimes I wish it would not try.

Jim

I agree, but finding someone versed in SMT isn't all that easy. I
think I have a person at our local college lined up, but I need to get
back to him. I will contact him today.

Whatever happened, it appeared to have to do with NVDI. A few fonts
were scrambled and had to be reinstalled. This doesn't explain the
black band issue though -- why would that start now?

There are several utilities. BOOTCONF should do the job, and it may
be found at the old Atari FTP site UMICH.
(http://www.umich.edu/~archive/atari/Falcon/Utilities/bootconf.zip
should be the direct address, but I haven't tested it myself.)

There is also a NVRAM .CPX module available. I think it will also
alter the language.

Well, can you email a photo or describe just what that "Apple
interface" looks like? Also, when you are at that interface, does the
mouse move a pointer?

Well,

If you like, you can ship your Falcon MB to me, costs about $18 each way
for priority mail. I will do this work plus bus overclock for free. I've
done 3 successfully now :) If you recall, I mailed you the JTAG cable to
update your CT60, but I'm sure you remember that.

Thanks,
Mark

Hallvard,

I would like to mirror this ftp site. This will entail an initial
download of the entire ftp site contents which possibly could incur you a
charge. Would it be okay for me to suck down the entire contents and
mirror your ftp on Atari-source.com?

Thanks,
Mark

1. On your Atari, open the STing Port CPX. Write down the ip address and MAC address.

2. On the PC, use a text editor to make a file called arp.bat. In the file place the following line. Of course you will replace these ip and mac entries with the information you've written down from your own Atari.

arp.exe -s 192.168.1.8 00-00-1c-1c-38-a7

Save the file and close the text editor.

3. Double click arp.bat to make this arp table entry valid. Add arp.bat to your autoconfig.bat file, or...simply drag it into the Windows Startup folder.

This is very important...if you don't do this, chances are that windows box will ignore the ethernec.

Source record: 16067

Hey everyone,

I just wanted to let you know that I am working hard on bringing the Atari-source portal and mirrors back up. I don't know if they are working for anybody at all right now. I'm having some sort of very strange networking issue. After the server boots, it runs perfectly for about 15 minutes at which time all network access stops except for other machines on the same subnet, such that I can ssh to another server and then get into this one. I haven't yet figured out the problem but I will.. And when I do, all will be well.

Also for those who might instantly think netmask or broadcast problem, it's not. And it's not an iptables issue either. The more tests I make the more confused I am ;-)

PS: This server is also gim and sum cvs and also the sparemint development site amongst many other things so it's critical to get it alive again. Thought some people would be curious about what's going on.

Anyone.
I have a Falcon 030 (Actually its a MK IIneeds repaired) and wondering what sort of accelerators are available for a Falcon computer. As ALL of you know I have a Falcon 030 with a 72 mhz CT60 and a 25 mhz system bus but I want to have a descently fast computer as a backup without all the cost just in case something happened to my CT60ed falcon and would have to send it back to Rodolphe. I seem to remember a POWER UP 2 Accellerator awhile back, is this still available?? I also have a chance to get a MEGA STe. I noticed there are PAK030 upgrades on Mega STe are these still available and if so where??? Which would be more cost effective in upgrading??? Any Graphic Cards available for the MEGA STe as well?? I have an Eclipse which I am not using on my CT60 since the SUPERVIDEL will be coming soon enough that I figured why bother with the hassle of the Eclipse and the CT60 both.
Any help anyone can provide on this matter would be greatly appreciated.

Thanks,
Carey Christenson

Hi Carey

You aren't in the UK are you?.

I have a PAK accelerated MegaSTE with a MV300 graphics card that isn't in use, do you have an understanding bank manager??

Falcon has multiple languages in ROM. ST does not. You can change ST
language by changing ROMs or loading some programs at startup (but this
is not very usefull in no-HDD setup). English ROMs are avialible from,
check some shops (Best Electronics?)

You can get the PAK030 from Atari Workshop, however I doubt it works
out cost effective, it's very expensive, though it would give a
massive gick to a stock M-STe. Personally I think you'd be better off
boosting the Falcon, there is a lot more hardware for them kicking
around.

There are probably companies like system solutiones in the UK that
might have a powerup2 left, but why bother buying one for the huge
amount of cash they will ask, cos you could build your own accelerator
quite easily if you have a soldering iron and know how to use it. Its
not rocket science. Have a look at http://atari.nvg.org/cpu_accel/
which is a bit of a convoluted doc, but read it through a couple of
times and you have a BUS accelerator. All the powerup2 does is take
the 32mhz system clock and pump it straight to the CPU instead of the
16mhz from the combel, and you can switch between them using the ACIA,
it does not accelerate the BUS at all. With the home built bus
accelerator and a good ram card you will have a 25mhz bus, and then a
home built CPU accelerator will give you a 32mhz CPU.

Coda.

I appreciate the offer Mark, and may indeed take you up on it. I had
a coworker lined up, but his daughter fell very seriously ill and
asking for a favor seemed inappropriate. I worked on the Falcon in
030 mode this morning, and I THINK it is now stable in 030 mode. NVDI
was corrupted, and something (perhaps NVDI) was stealing memory. We
had a power surge a while back, and perhaps that affected something.

The next step is to solve the mystery of the 2" or left half black bar
on some bootups. Since this affects even the CT60 bootup image, it
clearly isn't a software issue. I'm wondering if perhaps the modified
TOS was corrupted. I've been using 0.99g which is now outdated, so
I'll try installing the latest version.

That's really strange. As with SamF's Falcon, I'd suggest to try pressing down on the videl or combel while booting to see if it guarantees it goes away. Of course if it's very intermittent you have no real proof that you pressing on the chip was the cause of hte problem. That has to be a loose component I would think.

Charge? As in having to pay money? Not sure what you mean?

> Would it be okay for me to suck down the entire contents and
> mirror your ftp on Atari-source.com?

I appreciate you asking but I'd prefer if you link to it instead.
I've got a (pretty outdated) MIDI section of my (yet again outdated)
Atari ST website which links to the MIDI files with brief summaries:

http://launchpad.atari.net.nz/pages/midi.html

(even though the links to other sites are outdate, my own stuff is still
there and I have no plans for removing it).

I haven't added the Logic and X-alyzer stuff to it (the web page), and
don't know if I ever will (I kept updating that site for years, but
life's too short..), so if you like you can add a link to the FTP site
as well, or instead (which the above website points to anyway) as
mentioned earlier on and quoted at the beginning of this posting.

Guys, I'm a tad bit confused about something. I've got the CT60 working,
NVDI is up, etc, etc,...but what or where is the other software that I
keep seeing mentioned in the newsgroup?

I downloaded a file from Rodophes' site, but it had things like a modified
CPX, ACCs, etc,...

What AUTO folder programs should I have in there? Right now its only:

Extendos
NVDI
MINT

So what and where am I missing stuff?

Thanks in advance. :-)

If you have a simple OS you only need a simple machine, plus Atari is far
from dead, get your facts right and go troll somewhere else.

5888. AtarICQ 0.162 released

Newsgroup: comp.sys.atari.st
Date: 2004-11-17 15:12:45 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0411170712.7b71af30@posting.google.com>
Source record: 16083

Hi all,

It's once again time for a small update. With this release you'll find
that the most noticeable change is the addition of icon blinking,
making it easier to spot unread messages.

News in 0.162:

* Fixed a number of minor issues related to the viewing of a msg icon
in contact list. Icon shows up next to the contact that has sent us
messages that are not yet considered read. (See /preferences/messages
to set time out value for when a msg should be marked "read")

* Icon blinking added (in contact list) to draw further attention to
the msg icon, when there are unread message waiting for us. Go to the
section named "Messages" in the preferences window in case you wish to
enable or disable this feature. Default is ON.

* Fixed a bug which caused AtarICQ to (sometimes) fail when started
without a config file, and fastload flag was set.

* Up/down arrows had stopped working in msg window as of 0.161
release. Should be okay again now.

Read more and download AtarICQ here:

http://www.ataricq.org

That's not really fair. Windows XP is a simple OS. Simply dumb. If
you're going to migrate to another platform at least go with a good OS
like Linux or OSX.

Joakim,

Thanks for icon blinking! This is an important feature I plan to put into GIM as well but I have to get the icons to draw in the first place first ;-). I also plan to (attempt) to figure out how to block the main buddy list icon or the conversation window icon, which wouldn't make sense for aICQ. This feature though will make aicq much easier to use for me!

Thanks,
Mark

Yes, I was worried perhaps that the ISP that hosts the FTP will charge for
the excessive bandwidth utilization of sucking down the whole FTP site.
Mostly I was more interested in archiving the site, not necessarily that
there will be a ton of updates. I think it's important to get atari
software to as many places as possible to make sure it never disappears.

Thanks,
Mark

What you have will work, just like a plain devil's food cake can be
called "dessert". Now, it's time for the "frosting".

Add STing for a TCP/IP stack, a half dozen accessories and .cpx
modules for spice, and a nice desktop for visual appeal. The sky's
the limit.

What do you want your computer to be able to do?

Galen

Ever tried cleaning it. I use Windex(glass cleaner) I usually pop the key caps off, which is the biggest pain of cleaning it, but you'll be able to skip that.

5903. Apex Media and Genlock use

Newsgroup: comp.sys.atari.st
Date: 2004-11-18 02:14:59 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <BzTmd.34151$IQ.8446@bignews6.bellsouth.net>
Source record: 16098

Hi,

I have Apex Media v.2.00 and 2.41 and was wondering which Genlocks
suppose to work with the Genlock Option within Apex??

I have the Hama Tri-Lock and the Graffiti by Titan Designs.

I have a manual with the Hama which uses no software and works great!

However, I didn't get a manual with the Graffiti only a software disk
with "Graffiti Genlock (For STE) Clock Enable" hand written on the
label.

The Hama will work with any Atari, even PC's. What about the Graffiti,
Is it for the STE only like the disk leads me to believe or will it
also work with a Falcon or other Atari machines?

At first I thought it may have been made to work with Apex Media and the
Genlock option, but I really don't know.

Also, Is there any other software that came with the Graffiti when new
or made for it later?

I have a small book here that I can't find now, which lists 3rd party
hardware for the Ataris. Titan Designs is listed with some of there
older
hardware. A genlock is named along with 2 or 3 programs for it. I can't
remember the names ATM, Anyone know anything about these or
are they Vaporware?

Any help is appreciated,

phantomm@bellsouth.net

5904. Change Clock chip in Falcon?

Not really. If you have some desoldering experience, it should be no problem to de-solder the old chip pin by pin using a handheld de-soldering gun - in my experience, this works better than desoldering braid.

The methos that does the least damage to the PCB is cutting all the pins of the old chip and removing the remaining pins one by one, and then removing the tin from the holes. However, with the Dallas chip, it may be a bit difficult to get at the pins - however, if you cut through the plastic, this should work.

5918. FS: ICD AdSCSI Plus ST Host Adapters

Newsgroup: comp.sys.atari.st
Date: 2004-11-18 22:14:35 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2004.11.18.22.14.34.873298@nosspamatari-source.com>
Source record: 16012

Hello everyone,

I have a pair of ICD AdSCSI-PLUS ST Host adapters for sale.

http://toad.atari-source.com/ebay_images/icdscsihost.jpg

These boards have been professionally cleaned and aggressively
tested. They have been found to work perfectly. I would like $45 each
which already includes shipping costs for air mail anywhere worldwide or
priority mail within the US. The clock batteries are surely dead. If you
would like the battery replaced on your board before it is shipped, please
add an additional $3. This board has 1 19 pin ACSI port input, 1 19 pin
ACSI port output and 1 internal 50 pin SCSI interface. This makes it
perfect for an external case but suitable for an internal HDD project.
There's some slight trace bubbling on both boards but it does not seem to
affect anything as they are well-coated with a protectant. However if one
of those traces should break I will repair the board for free for up to
one year (at my discretion of course, neglectful or abusive treatment will
not be covered).

I accept mastercard, visa, etc via Paypal.

Please contact me with username mduckworth at domain name atari-source.com
for more details including the correct paypal email address. Cash check
or money order also accepted.

In the near future, I will be selling a good number of unique and rare
atari 16/32 items. For a list or to express interest, please email me.

Several posters in this newsgroup can vouch for my reliability and
technical expertise in testing and shipping if that's an issue.

Thanks,
Mark

One thing I forgot to note is that these boards need a custom power supply
connector. I can make and include an adapter from this connector to a
normal Molex drive connector if you like. This would cost an additional
$5.

Thanks,
Mark

Well, the CT60 runs pretty much everything that is GEM based that would normally run on a Falcon. If it shows up in a window, odds are that the CT60 will run it (though you might have to disable the cache from time to time). A lot of demos and games will not run in CT60 mode, so you have to switch to 030 mode to run them.

My personal experience is that I notice snappier screen redraws and an overall improvement similar to when comparing an ST and a Falcon in ST High resolution. Quicken 8 for DOS under SoftPC now keeps up with my typing, and CAB is much more pleasant to use. Most of my other applications ran plenty fast on a stock Falcon, but the few that didn't are greatly improved. As for new applications, a couple of games (like Quake) require something like the CT60 to be playable, and multitasking heavy CPU programs like Aniplayer appreciate the extra power. Primarily though, you just have a really fast Falcon. There is almost nothing that REQUIRES a CT60.

Now if you want to know what you can do with an Atari Falcon....
(that's a whole other topic).

Simple. If their machine a stock ST, then the floppy is probably a
program disk. If not, then it is a modified OS of some sort. TOS
programs might be able to repair a damaged program, but couldn't help
much with a foreign OS.

Well, I was rummaging through some old boxes of Atari stuff and I found what appears to be, at least part of the 1.44 floppy upgrade kit for the Atari TT030. Its the Ajax chip. Also, it looks like I have the HD cover, screws, shielding and P/S cable, for the upgrade to a hard drive. Now, I was planning (years ago) on getting a TT, but with my CT60 Falcon now, I've no reason to.

If anyone wants to e-mail me (fastest route) with their address I'd be more than glad to donate to the cause. Please, don't ask for it unless you are a TT owner who needs this. I'd think pretty lowly of someone who wanted it just so they could turn around and sell it for a quick (and dirty) profit.

Check that you've got enough headroom for replacing the keyboard.

Consider removing top of NVRAM chip and connecting a button cell
externally.

You're welcome.

There is no sonne.ol on the Outline Art 3 disks, at least no on mine
version. Anyway sonne.ol is just a vector graphics of the sun.
A corrupt whatever.ol doesn't affect the good working of Outline Art.

Not me. I have 2 TT's with 1.44meg floppys. Though this would probably
function great in my MSTe which has 720K. But I need TOS 2.06 for that
thing.

Thanks,
Mark

With my experience and my iron, I would desolder the old chip and put in a socket simple as that. For most people I recommend good old dremel as Derryck suggested as it's much easier (even if a little more dangerous if you dig too deep).

Thanks,
Mark

5930. Why you should use MiNTnet/Magxnet

Newsgroup: comp.sys.atari.st
Date: 2004-11-19 17:06:00 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2004.11.19.17.05.59.717581@nosspamatari-source.com>
Source record: 16025

Hey guys,

I notice that some people are still using STing, and even using it under MiNT. I thought it would be beneficial to point out the reasons not to use it. Pure and simple, Sting has rediculous internal latency. In upwards of 25ms pinging the loopback interface on an ST. Under MiNTnet/Magxnet you do not have this problem. Latency is much lower.

If you are a CT60 and ethernec user, mintnet and magxnet begins to be the only sane decision. With mintnet you can perfectly emulate stik and run all those apps but you can't do vice versa. There's lots of mintnet internet apps you would miss out on. Like... ftp ;) or telnet.. or anything. You'll miss out on Sparemint Update Manager too. It assumes Mintnet. But that's not the real reason. With mintnet you can get upwards of 400KBytes/sec through your ethernec using ozk's driver. With sting you won't have anywhere near that kind of performance and things will probably be a bit more stable.

I understand the text config files can look a bit daunting, but if any Sting under MiNT users need help setting it up, ask here and I'll answer.

PS: Magxnet offers the same benefits under MagiC too! And it can run gluestik for stik apps too.

I mean think about it. Once you have an ethernet card, how often do you go into those stik cpx's? Thought so ;) So is text mode really that bad for setting up your ethernet... once?

Not trying to bash on anyone or anything, I just see spectacular performance and reliability and I think others should see it too if they want that sort of thing.

Thanks,
Mark

Hi,

Modified enclosure - I cut the holes and fit the card...

UnModified enclosure - You cut the holes and fit the card and I keep
my fingers :)

If you have time and are handy with sharp objects, feel free to order
the unmodified box.

I have only 3 fingers and opposing thumbs left, lost the rest to
soldering iron and box cutter, scalpel, etc...

Whether you order the box cut or uncut, I will include a nice
'EtherNEC' label to put on the box...

I dont include a CAT5 cable if that what you mean. Those are available
everywhere. I include the ribbon cable between the cartridge interface
and ethernec main board.

I will try to put up a picture of the completed unit sometime today.

http://www.atariuniverse.com/forsale/ethernec/ethernec_box.html

For those who already ordered, shipping should be starting around
Monday-Tuesday Nov. 22-23

Thanks,
Rory

The ST was little more than a PC with a 68K....FAT file system, warmed over
CP/M68K, Gem.....urghh

Now what you needed was a REAL machine with a REAL OS.....

Besides, If your NIC is (soon to be) a CTLINK or ETHERNAT and you want
a proper USB implementation too, then it looks like MiNT/Mintnet is
what you will need.

Coda.

Hi, Roland!

RM> I have archieved together with the files an
RM>
RM> AR.PRG 21829 Bytes

You could install a free atari emulator to use the AR program. Or send it to me (my reply to address is read), I'd check if it really is a packer software. Google pointed to an ST-Computer article about Marc Williams C, which comes with an AR.PRG as the so-called librarian (must be some kind of library generator)...

Regards,

Alexander

Turning off the firewall should have done the trick. That is what I did on
my wife's computer and I was able to get everything working. It must a setting
somewhere in the Windows XP or else you need to re-install the ftp server.
The guy who installed XP on my wife's PC, told her to tell me that I should
re-install the ftp server program. Once I did that and turned off the
firewall, things were great...

I would appreciate practical help to persuade my young sister to use text in her email, rather than HTML. She will only communicate by voice phone because her support says she cannot use text email on Windows XP Pro (if that is the correct name of her system).

Is this true? Can anyone inform me whether she can conform her email to produce true text format emails, please? And exactly how?

What do I tell her -- "exactlty how", if possible-- please?

Thank you.
Charles.

The original company that put this great game out still has a website
where you can download Vroom and other great ST and Amiga games:

http://www.lankhor.net/jeux/jeux.php3?jeu=32&menu=presentation

Telechargement is download in French but click on the English flag and
you can get English version of the games :-)

why? If there's an OS that's being held together with spit, bailing
wire and bubble gum, it's Windows. With security leaks and holes big
enough to fly Red Dwarf through it.

and speaking of Red Dwarf, are you in any way related to one Arnold
J. Rimmer? :)

What client is she using, if its Outlook or Outlook express then that
definitely can be switched to plain text, and on a per user basis if reqd in
OE

Just like "support" (I use the term lightly) to say that!

First, what e-mail program is she using? If it's Outlook Express (most likely), you simply find the "plain text" option and click on it. I forget the details of exactly where that's found (I don't use the PC version all that often, thank God!), but I'll check on my Windows system at work and find out for you. It's not too difficult to find, if I remember correctly. You'll see two options, one for plain text, and one for "rich text" (html, as described by Gates). I'm sure other programs have the same option. I'll get back to you when I know for sure how to get there. Good luck!

Bloody awesome, thanks mate. I played Vroom to death, when I was
younger. I will have to see if it works on the TT.

Agreed in spades. A connection under Magxnet stonks along - and you can
still use your STinG, MiNT and yes, IConnect clients given that the
matching gateways are installed.

Yes, setting up means getting to grips with config files and it would
help if they were all located in the same folder, but you will learn
more about setting up a network by doing this.

I would just like to add that most text configs files are as easy or
easier to setup as GUI setup. They are usualy quite well documented and
explained within the config text (check mint.cnf for example) some even
contain too much explanations so they are quite big :) Od course, "i will
do all instead of user" installer IS easier, but in case of even simple
problem, user is in dark, while in case of text configuration files, one
can read cfg file and in case that itis well explained fix many stuff
without special knowledge.. and even learn a lot.

Main reason is i think that many ppl use MultiTOS like setup (aka
kernel+AES only) and dont have required unix FS structure so they have
either to install full MiNT or fiddle with cripple MiNT (i think) or
similar... But benefits are worth of end result.

An older version of HDDriver is available from Best Electronics in
California. The latest version needs to be ordered from Europe, but
that isn't too hard if you have a Visa card.

Extendos Gold is provided by Anodyne Software, a Canadian company.

>
> Is this true?

No. The exact technique depends on the email program she uses. Under
Outlook Express 5 she needs to choose Tools -> Options and under the
"Send" tab select Text. Under Outlook 2002 it is still under Tools ->
Options and under the "Mail Format" tab. Netscape Mail puts the
choice under the "Format" pulldown.

If you can run MyMail, you can still get her emails. The HTML files
show up as attachments which can be saved to disk and run by CAB.

I sent cash directly to the author. Worked out well and I think it was a
little bit cheaper, but German manual only. No big deal if you know what
you're doing. Usenet people will help you too.

> Extendos Gold is provided by Anodyne Software, a Canadian company.
>
> Galen

I've ordered from Roger before. I believe he runs the North American
portion of Europe-shareware.org. I purchased a number of titles and sent
him the money. Very easy. Some day I'll upgrade my ancient version of
extendos so I can use it again ;-)

Thanks,
Mark

5975. CDwriter problems...

Newsgroup: comp.sys.atari.st
Date: 2004-11-23 09:55:06 UTC
From: Raoul Teulings <rt@xs4all.nl>
Message-ID: <1101207416-118008AEicMi@xs4all.nl>
Source record: 15970

Since a couple of days i connected a LaCie CDwriter to my TT. At first it all seems to work: the writer was recognized by HDDriver and i could use CDPro to make a few burns. But then after a restart the next morning it was all 'gone': the writer was not recognized anymore and CDPro did not work any longer.

Same thing happened with my Pioneer CDplayer who used to work in previous times.

Does somebody know what goes wrong? Has it got something to do with a program that changes the order of the proggies in the autofolder? Or should i have reinstalled HDDriver after connecting the writer? (Due to a move of studios i am not able to quickly find my manual of HDDriver)

Has somebody similar problems? I made two backups and the alst one during the night and this one froze. What might cause that?

When i turn my TT on now i get the nessage that 'drive c may be damaged' and after disconecting the writer this message is gone; so i guess it has to do with the termination?

i hope that someone can give me a hand here because making CD backups is very necessary for me because i still work on a daily basis with the TT....

Thanks,

Raoul Teulings

I wasn't aware that the budget for windows development extended to
Bubblegum, I thought they had blown the lot on pretty icons and title
bars, which obviously give a huge gain in productivity compared to
say, ensuring system stability :)

Seems to be another marginal SCSI bus problem. How long are your
cables, did you change cable positions, and where is your
termination?

On my TT, the problem has always been termination. I should have
shorter cables, and will someday get around to that. So, in
my experience, cable length is not serious problem. But if all
your cables are 1 meter long, and you have a full or almost full bus,
it might be a problem.

I presume you use Extendos, which wants to run as the last auto
folder program, unless under MiNT 1.16.x, when it gets more
complicated. Has Extendos moved? In the wrong boot order, it may
load without errors, but do nothing.

Dirsort.prg seems to be the best program for sorting an
autofolder.

If the LaCie (I have a Yamaha> is the only thing on the bus,
you accidentally moved a termination switch, or need an external
active terminator, which can be had in the USA from cs-electronics
and from Black Box. Turn the LaCie around and look at its back
panel carefully. Wiggle the termination select switch, if it has
one. If it does not have one, note the connector style, and find
a .nl source of active terminators for that bus connector.

Or, you might have a lack of terminator power, and otherwise
good terminators. I just did that exercise on my TT bus. Modern
drives do not provide TERMPWR, so I provided for that with a
messy-looking jumper in one SCSI box. Where does your LaCie get
its TERMPWR according to its manual?

Jim

It's rather unusual for a drive to work fine one day and not the next.
Could the external CD's power supply be bad? I do hope you didn't
plug or unplug anything while the system was on! Did you move a
cable? SCSI cables often aren't fond of being moved for various
reasons.
>
> Has it got something to do with a program that changes the order of the
> proggies in the autofolder?

Well, autofolder order does matter. Did you change anything?

> Or should i have reinstalled HDDriver after connecting the writer?

This is generally not needed. Does HDDriver see the drive on the bus?

> Has somebody similar problems? I made two backups and the alst
> one during the night and this one froze. What might cause that?

Do you mean that the CD is recognized and that you can start writing
to it but then it freezes?

> When i turn my TT on now i get the nessage that 'drive c may be
> damaged' and after disconecting the writer this message is gone; so
> i guess it has to do with the termination?

It is very likely due to termination or some other hardware issue.

Please describe what is hooked to the SCSI port of your TT and in what
order.

I want to connect a new external 56k modem to a TT. Are there any paticular ones that work well, or ones to avoid? I'm looking at the Dynamode 56k external modem which uses the Conexant chipset and seeems to be as standard as you can get. If anyone has any stories connected with this one please let me know!

Also is it possible to use a 56k modem on a normal STe with the slow serial port (at lower speed obviously), or will it just refuse to work at all?

Raoul,

My TT acts very strangely in this respect too. I took the Termination resistors out of the motherboard and connected a JAZ drive, and a CD drive (in that order) to the external scsi socket. Termination of JAZ was OFF, and Termination of CD drive was ON. When booting the system, the hard drive would not be found most of the time. When it did boot, it screwed the partition up and I had to re-install everything.

What I had to do in the end was turn on the Termination on the JAZ drive which is in the middle (I know, its not correct), and then the hard drive booted and the CD was found also. I checked the disks often and theres no problem. I think what it needs as a permanent measure is an active terminator after the CD drive.

Coda.

Source record: 15988

Hi, Coda!

In the TT usually the resistor networks in the main board socket are the only terminators on the SCSI-bus. The internal HD usually is not terminated. So when you plug external SCSI components to the bus you should remove the resistor networks from the TT board, turn on the internal HD's termination (by jumper or by putting in the appropriate resistor networks), ensure that the TermPWR on the SCSI bus is driven (the TT does not do this by default) and then terminate the outermost external component.

In your case it might be that the JAZ is close enough on the bus to your HD so that its termination can do a similar job as the TT's internal termination - damp reflections to an acceptable level although the internal HD is not terminated.

Regards,

Alexander

I differ, and not just for the purpose of differing. First, both ends
of the bus need to be terminated, so there is no reason to unplug
the TT terminator packs. The TT cannot provide TERMPWR because it
has a 25-pin connector, and TERMPWR is on pin 26 of a 50-pin connector.
There can be no connection at the TT end of that cable. Something
external has to provide TERMPWR.

On why the bus with the JAZ drive on it works, I agree, for the purpose
of agreeing. Iomega stuff seems to have good terminators, and uncertain
termination selection switches. My ZIP has an external active terminator,
hanging on the end of a 25-pin to C-50 adapter.

They all work. A modem is a modem, but I prefer, for better manual
and nicer front panel layout (no accounting for taste) Supra, now
gone.

I have a Supra 56K modem. It and an ST or STE went with me to a
motel room when working contract jobs away from home, and went
home to my TT on weekends. Now I have a local job, and it stays
on my TT.

I am told that if you do not move the mouse, you can set a ST
to work with Modem 1 as fast as a TT at Serial 2.

Hi,

Well i just think that it is more readable for other (not the readers involved in debate) as if i would make 2 or even more replies directly to authors, or open new thread. So just take 2-3 quotations and add remarks. If i would mean direct reply, i would surely use proper message. It is public group, replying to more people would fragment the thread a lot imho....

Most likely you will get no more than a 28000k connection, maybe a
little more than that if you have a good telephone line.

So no worries there, but you'll find that actual _data_ throughput will
be the limiting factor - so make sure that you have HSModem installed to
optimise this.

Gee, there are worse things in the world as supposedly misqoting. Don't wory i wont misquote again. No use to reply or anything if ppl are reacting on such things. I do not wish to add anything to debate, if ill trigger such response with such banal reason. And last but not least: what all this has to do with subject anyway? U are right, context is lost.

As long as you're using a patch for the buggy serial port routines,
e.g.. HSModem, it should work fine. You'll only get 19200bps on the STE
though without a hardware modification, and you'll may see no difference
in actual transfer rates between the 56k modem and a 14.4k modem.

There is a modification to the ST/STE that can speed it up to
38400bps[0] although, to see a real improvement, you'll want to either
replace the processor with a faster processor upgrade or to replace TOS
with Magic.

With just the serial port modification, and using plain TOS, STiK/STing
will drop a very small amount of incoming data, which will then require
retransmission, slowing the transfer rates down a touch. While this
won't, or at least shouldn't, slow the speed down below 19200bps, you
won't see the full 38400bps. By adding Magic, the 38400bps rate is fully
stable, there should be no dropped data and, you should see a transfer
rate of between 3.5 and 3.8kbytes/s.

[0] 57600bps is also possible[1], but a stock STE with Magic may lose
the occasional bit of data[2]. A faster processor is certainly required
if you're hoping to be able to use STiK/STing. An 8MHz STE is too slow

[1] And about the highest you could get without doing some major
hardware modifications.

[2] Experienced many years ago, while using BBSs. Sometimes a character
would be dropped which would corrupt the menu screens but, as long as I
used GSZRZ, which was configured to turn off the mouse during file
transfers, things were fine.

Regards,
David Bolt

Hello Raoul,

Unplug the TT's internal resistors, ensure that the internal HDD as
well as the last external device provide termpower and is correctly
terminated.
On my TT, Extendos isn't the last autoprog, and it works fine.
In HD-Driver, ensure that :
- Settings / SCSI-Driver / Atari SCSI
SCSI-Reset on error, SCSI-Reset at boot and SCSI Processor device
are checked
- Settings / Bootparameter / SCSI-ID is correctly set (usually 7)
- the units are correctly recognized and configure, and use Autoconfig
in the Tools menu to avoid problems, even if you already manually set
your devices' IDs... you'd be surprised!
And, I almost forgot : *never* use active terminators : HD-Driver seems
not to like them on the internal HD on both my TT and a friend's one!

Good luck,

J.-Luc

This is not entirely true. While it IS true that both ends of the bus
need to be terminated, the TT is wired as follows:

Internal harddisk -- the host adapter -- internal terminators --
external connector.

Thus the internal harddisk should ALWAYS be terminated on a TT and the
internal terminators should ONLY exist if you have nothing externally
connected.
(Note that most PC and Macintosh computers are wired differently.)

> The TT cannot provide TERMPWR because it has a 25-pin connector, and TERMPWR
> is on pin 26 of a 50-pin connector. There can be no connection at the TT
> end of that cable. Something external has to provide TERMPWR.

This is mostly true. The TT does not provide TERMPWR. (Some Macs do,
on pin 25 of their 25 pin connector). Therefore, any external drives
must be set to provide TERMPWR and MUST BE ON WHENEVER THE TT IS ON!

> On why the bus with the JAZ drive on it works, I agree, for the purpose

> hanging on the end of a 25-pin to C-50 adapter.

I also agree. I have seen working SCSI busses completely out of
compliance with the "terminate both ends" rule. For instance, my own
Falcon required a "pass-through" terminator in addition to the
terminator on my scanner before it was stable. I have no idea why.

Avoid winmodems, of course. I've been able to get several modems
working with never a problem. Personally, I think that a physical
power switch is essential (helps with lockups) and the more lights the
better (helps with troubleshooting).

>
> Also is it possible to use a 56k modem on a normal STe with the slow

The handshaking protocol of a modem has it attempt successively slower
speeds until a connection is made. As long as you configure your
modem correctly, it should work fine.

I think the confusion is the first line which was probably inserted
automatically by whatever software program was being used. It gives
the impression that "smeg" wrote the two lines that follow even though
the double ">" marks note a reply to a reply. I've run afoul of this
myself, so I understand smeg's sensitivity on this subject.

6010. Is there special Midi Cables for ST

Newsgroup: comp.sys.atari.st
Date: 2004-11-24 21:34:44 UTC
From: atarikid <atarikid@cox.net>
Message-ID: <5jv9q055goviigelmk0699hlemu2mekm3r@4ax.com>
Source record: 15901

I read in the Pro24 Manual that Atari incorporated Midi Thru in the
Midi Out port of the STs. It also says that some Midi cables will
short these extra pins and it won't work.

Question: Do I need a special Midi cable for the Midi Out on my Mega?

Thanks,
B

6011. LAN Ports on ATARIs

Newsgroup: comp.sys.atari.st
Date: 2004-11-25 01:02:23 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <L9apd.42839$jE2.41884@bignews4.bellsouth.net>
Source record: 15906

I've a few questions on the under-used Atari LAN ports on the MegaSTE,
TT, and Falcon.

To the best of my knowledge, STing is about the only package that has
support for Atari LAN. If I am wrong do correct me.

1. Are the LAN ports on each machine, the same?

If any are different, In what way are they different?

2. What do I need to use the LAN port of any one of these with a modem
for connecting to a BBS or NET?

3. What do I need to use the LAN port of any 2 machines to connect
together to access files and etc from one another over
the LAN ports?

4. Does HSModem include patches for the Atari LAN ports?

5. Can one have 2 Falcons connected together with the LAN ports
transferring a file over the ports and Dial out on each
Falcon Modem port to a BBS and or Net all at the same time? Or is LAN
port and Modem port on Falcon tied together in
such a way that only one can be used at a time?

6. Are there any FAQs or collection of info on the Atari LAN ports on
the Net somewhere?

7. Which was the first Atari that came out with a LAN port?

7a. Didn't anyone use the first Atari LAN port for connecting 2 similar
Ataris together or for Modem use or something?

7b. I don't understand why the lack of use of this port.

8. Didn't Atari create any software for the LAN port or was it suppose
to have been plug and play?

9. I have APPLE type LAN cables for modems, and for connecting LAN port
to LAN port and a few other things.
Should these be PIN compatible for Atari LAN or do I need to change a
wire(s).

I know I've asked alot of questions on Atari LAN, but for as long as
I've been using Ataris, I've not seen much info
on the subject. If the ports are good, One would think there would be
more support for them.

Any help is appreciated,

phantomm@bellsouth.net

6012. KeyBoard compatibility

Newsgroup: comp.sys.atari.st
Date: 2004-11-25 01:20:09 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <oqapd.42847$jE2.34979@bignews4.bellsouth.net>
Source record: 15907

I have a keyboard here thats out of a 520/1040STE or maybe from an earlier 1040ST.
(Never had a 1040ST so I don't know if it is compatible with a 1040STE or not)

Do the keyboards for these 2 types of Ataris have the same type of Motherboard connector?

Reason I ask is the keyboard I have looks like it has the same type of motherboard connector as a
stock Falcon does and is about the same size and shape. Only difference is the color of the keys are white.

Will this keyboard work in a stock Falcon without modification?

> the LAN ports?

There was a package sold years ago, called Lan-net or something. Apart
from that, nothing I am aware of.
>
> 4. Does HSModem include patches for the Atari LAN ports?

Yes

http://www.bygjohn.fsnet.co.uk/atari/texts/hsm_sett.html
>
> 5. Can one have 2 Falcons connected together with the LAN ports
> transferring a file over the ports and Dial out on each
> Falcon Modem port to a BBS and or Net all at the same time? Or is LAN
> port and Modem port on Falcon tied together in
> such a way that only one can be used at a time?

It would seem so,
http://sparemint.atariforge.net/mailinglist/Mailing-Lists/MiNT-List.200001/Pine.MNT.4.10.1
0001291534560.75-100000@rakas.text

watch the wrap.
port names on the machines:
==========

```
device name ST MegaSTE TT Falcon
-------------------------------------------------------------
modem1/ttyS1 MODEM MODEM1 MODEM1 (no connector)
modem2/ttyS2 - MODEM2 MODEM2 MODEM2
serial1/ttyS3 - - SERIAL1 -
serial2/ttyS4 - SERIAL2 SERIAL2 -
lan/ttyS4 - LAN LAN LAN
midi/ttyS5 Midi Midi Midi Midi

Modem1/Serial1 are always MFP ports, while Modem2/Serial2/LAN are
always SCC ports.

NOTE: Serial2 and LAN are mutually exclusive, on the MegaSTE and
TT; selecting Serial2 disables LAN and vice-versa, because
they both use SCC-A. Changing one bit on the sound chip
alters the selection to one connector or the other.

Here is the important bit.
>
>
> 6. Are there any FAQs or collection of info on the Atari LAN ports on
> the Net somewhere?

Not that I know of.
>
> 7. Which was the first Atari that came out with a LAN port?

TT, then MegaSTE, then Falcon030.
>

Bit slow, by todays standards, ethernet is a hell of a lot quicker.
Between my TT and second Falcon I use SCSI bus arbitration. Very quick.

Hope this helps.

6018. [ANN]Zview Beta 3

Newsgroup: comp.sys.atari.st
Date: 2004-11-25 06:28:40 UTC
From: Zorro <Zorro271-1@yahoo.fr>
Message-ID: <41a57b9d$0$7840$ba620e4c@news.skynet.be>
Source record: 15913

Hi,

New version of zview available.

First, I want to make a big thanks at Arnaud Bercegeay and Dominique
Bï¿½rï¿½ziat for their work on the gemlib, mem.ldg, libshare and windom.
GREAT WORK MEN !

So, what news it this version?

- zView goes to LGPL.
- TGA read plugin added(15, 16, 24, 32 bits normal and compressed).
- BMP read plugin added(1, 4, 8, 24 bits non compressed).
- JPG read plugin with DSP added. (move JPG.LDG from '/dsp'
to '/plugin/decoder' and install jpgd.prg in your auto folder).
- Option panel for the jpg encoder added... with this one, you can
set the image quality wanted, progressive and grayscale mode.
- The image viewer provides now a Info bar with basic information like
resolution, color bits and image type.
- Add delete function in the menu bar.
- MEM.LDG from dominique Bereziat is now used for memory allocation
(more safe for MagiC system).
- The dithering routine is now better for 8 and 4 bits resolution.
- Handle of multi-pages Image format; first step for the fax and PDF
reading.
- Menu "history" activated.
- the "jpe" image are now decoded with the JPG plugin.
- And a lot of bugs fixes!

This version is "normally" bugs free, if you meet one, please, send me a
little repport!

A last thing: Many thanks to all the persons who sent me a user repport
with the first version, thanks again !

http://the.zorro.free.fr/zview.html

No. Standard MIDI cables will do fine.
I don't have the pinout for the Atari ST MIDI connectors in front of me
right now, but from memory I believe the middle pin and the two pins
closest to it on each side are the standard MIDI pins (marked with a "*"
in my attempt to illustrate this:

```
*
* *
- -
```

While the "-" pins are unused.
From memory I believe that some manufacturers of MIDI cables short the
outermost pins with the pin next to it (for completely unknown reasons),
which would cause trouble with the ST as the unstandard thing it does is
use those (outermost) pins for a "thru" function.

So to conclude: be sure to get *standard* MIDI cables where there is no
shorting of pins. Impossible to see, but with a multimeter you should
easily be able to check this.

Correct me someone if I'm wrong with all the details.

To anyone,
I was wondering if there are any accelerators with Fast Ram still
available anywhere. If there are NO accelerators about a Fast Ram
module, I had heard that the MAGNUM FAST RAM card for the Falcon is also
an option. I have found web pages that show how to speed up the falcons
own 030 processor so I may end up doing that with the bus speeder option
as well. If anyone has an accelerator that is not currently in use on
there falcon and they wish to get rid of it please e-mail me at the
following e-mail address:

falcon060<at> a d e l p h i a <dot> n e t

Please NOTE that any accelerator that you are not using MUST have FAST
ram. Reason, I have 512 megs on my CT60 and could not LIVE with just 14
megs of STRam. This is just going to be a backup computer that will be
used occasionally but even for occassional work I need more than 14 megs
of memory. 32 megs or higher would be low end for the FAST RAM part of
the accelerator. Also while I am thinking about it. Is there any web
pages out there that tell about all Falcon accelerators that were made???

Thanks in advance,
Carey Christenson

Source record: 15918

The underlying idea is pullups wherever they seem to be needed.

My experience is that the resistor packs stay, and the internal drive is terminated with its own terminators.

That is working right now, with a scsi bus that has one opening left. But what do you do with an internal drive of the latest type, with an appropriate adapter that provided neither terminators or termination power? Or, for that matter, an external drive that provides neither terminators or term power?

I think we are picking nits. Pin 25 TERMPWR needs a way to get to pin 26 of a cable. Special and custom cable required.

Following mindless rules is not important. Making a bus work is important, and that sometimes mean pullups in odd places, or allows pullups in odd places, or even requires pullups in odd places. Drives do have capacitance problems, particularly Seagate drives, and may need extra pullup current. It is probably better to think in terms of pullup voltage where is is useful than in terms of termination. Nothing terminates.

While your take on the internal arrangement of a TT is correct, I have yet to hear of a TT that had a SCSI bus which did not work because the passive resistor banks were missing. I leave them there, if only because I would probably misplace them otherwise.

Jim

: This is not entirely true. While it IS true that both ends of the bus
: need to be terminated, the TT is wired as follows:

: Internal harddisk -- the host adapter -- internal terminators --
: external connector.

: Thus the internal harddisk should ALWAYS be terminated on a TT and the
: internal terminators should ONLY exist if you have nothing externally
: connected.
: (Note that most PC and Macintosh computers are wired differently.)

: > The TT cannot provide TERMPWR because it has a 25-pin connector, and
TERMPWR : > is on pin 26 of a 50-pin connector. There can be no
connection at the TT : > end of that cable. Something external has to
provide TERMPWR.

: This is mostly true. The TT does not provide TERMPWR. (Some Macs do,
: on pin 25 of their 25 pin connector). Therefore, any external drives
: must be set to provide TERMPWR and MUST BE ON WHENEVER THE TT IS ON!
:
: > On why the bus with the JAZ drive on it works, I agree, for the purpose
: > of agreeing. Iomega stuff seems to have good terminators, and uncertain
: > termination selection switches. My ZIP has an external active terminator,
: > hanging on the end of a 25-pin to C-50 adapter.

: I also agree. I have seen working SCSI busses completely out of
: compliance with the "terminate both ends" rule. For instance, my own
: Falcon required a "pass-through" terminator in addition to the
: terminator on my scanner before it was stable. I have no idea why.

Hi, i have just uploaded 4 more photos..

been very busy this week......

This Falcon is not a standard Falcon MK X, it's fitted with a Mighty Sonic
32 card...

Hey Mike,
how much do you want for your Mighty Sonic?
i have another Falcon in need of upgrading....it's only got 4MB !!!!

Hey everyone,

I downloaded the new release of zview and I must say I'm impressed. The truecolor icons really bring out GEM and make it good looking. So I ask, is there a way to use truecolor icons in the various desk environments that are offered? Thing, Jinnee, Magxdesk, etc

Thanks,
Mark

What you need is the Robert Schaffner's Falcon Doit archive. Get it
from here: http://www.doitarchive.de/homepage.htm. You must register
on the website to get the unzip key. Everything you want to know is in
that archive.

Coda.

Hi Mike,

I'm in no hurry... i have just orderd a 14MB ram card for my other Falcon..
40 UK Pounds.... i don't know what that is in US money....
if the MS was up for sale i could have saved myself the 14MB and just gone
for the MS..

Oh and while we are on the subject of money... i purchased that Falcon MK X
with the MS for
only 130 UK Pounds !!!!!

money well spent !!

kind regards

Ok, Does anyone have one of these laying around there place that is not
being used and would be willing to part with it for a reasonable amount
of money. Are there any TT-Ram or Fast Ram cards that would plug into
the expansion port on the Falcon. As stated earlier in this thread I
have documentation on how to speed the CPU up to 32 mhz or higher
possibly 40 mhz. So I am not as worried about the accelerator part as I
am the Fast Ram part. But if the only way to get extra memory is to get
an accelerator than I am all ears guys.

I have gotten it down to lower than 150 megs. I once left the computer
on for 3 days and had surfed the web all 3 of those days. I CACHE
EVERYTHING in RAM. Including images as well as my internet CACHE. I

started it up FRIDAY when I got home never shut it down and surfed all
day saturday 8 to 9 hours straight. Trying to find new Atari web pages
to visit. I also use all of that memory as a RAMDISK. I have a ramdisk
program that is what they call a floating RAMDISK that utilizes all but
about 1 meg of the available amount of memory. I like to burn on RW's
so I am able to burn at 6X with my CD burner thanks to the RAMDISK. But
to answer your question I have come very close to using all of it many
times while burning discs. But as far as everyday use maybe 100 to 200
megs was all I have used at the most. But it is always nice to have
that little extra when ever you need it.

On the DoitFaqST or F030. The F030 seemed to be ALL in german which
dont do me alot of good since I dont understand german. I will download
the ST one and see what is in there. Thanks for the information.
Anyone else have ANYTHING???

Looking good!
I like the clean, simple "high tech" design.
But not a 19" rack like I had assumed in the past.

No, it's not possible with the actuals desktops.

For information, zview is very modular and the code provides already
most of the thinks for write a desktop.

Maybe that one day, someone will makes a modern desktop with it... I hope.

Ciao,
Zorro

I was hoping perhaps that this thread could cause someone to think about
implementing such code into Teradesk or Thing if the author is still
around.

Thanks,
Mark

I agree with everything youve said here. Its not often that you have
to deviate from standards to get something to work, but if you must...

I remember my TT's SCSI worked fine until I removed those resistors,
regardless of whether anything was pluggined in externally. I think I
will refit them before they are misplaced.

Coda.

Teradesk was only recently updated, so I assume its still alive. I
doubt that Thing will ever get another update, shame as its one of the
better desktops.

Coda.

> better desktops.

The best desktop on Atari is Jinnee 2.x, this one is a superb piece of software but not updated since 3 years.

If someone knows the authors or if the author itself read this post, I will be VERY happy to continue the project for to add True color icon's support, network volume mounting (Samba, nfs and FTP), icon created from picture file(like in zview) and others funnies things.

Ciao,
Zorro

Whats the point?, how many Atari's are capable of displaying True Colour?
The STe is only capable of 4096 colurs, the remaining machines capable of
using Graphics cards are such a small percentage it would hardly be
profitable for any authour to implement.

I have 3 Monochrome Atari Monitors:

1 SM124
1 SM146 with tilt & swivel stand
1 SM144 with tilt & swivel stand

Unfortunately, I can't keep them any more due to space restrictions.

The SM144 and 146 both say "Sowerby Bridge High School" on them, but I acquired them from the school via legal means and have the documentation (somewhere) to prove it. I'm not shipping them anywhere, so if you want one or more you'll have to be willing to come to Bradford, West Yorkshire, UK, to collect it/them. Pictures and contact details at http://www.pitofdarkness.com/freeataristuff/freeataristuff.html

Well you can get Extendos from Anodyne. They are in Canada. Roger Burrows is good to work with. I received my copy of HDDriver from Germany and if I was you I would go that route. Uwe will put your name down in his list of registered users so you can get upgrades from him. The closest place to get it may be Homa Systems in Canada. I thought they were carrying it, but I could be wrong...

Hello Raoul,

What are you using for the CD driver? I use Extendos Pro and one time I had the same problem and it was due to the fact the the Extendos settings were messed up. I had to redo everything before it worked and I always keep a backup of the settings just in case. Does HDDriver recognize the CD drives?

Not as far as I know. There are little devices that will separate the MIDI OUT and MIDI THRU ports so you can use both of them. I have one. Can't imagaine why Atari would combine them. Also, software like Tiger Cub will allow use of the Midi Thru without direct separation.

Being profitable is the Atari world is not the point. The point is to due it
because it needs/should be done.

Since I deal with more than computers, that wouldn't work either, and an .org is supposed to be for a non-profit organization, not commercial (.com). I don't like when sites start using the wrong type at the end.

Anyway, the reason I selected 8bitclassics is because that is what I know, and that is what I am focusing on, but I will be adding newer systems as time goes on. Thinking of it, I only have some Atari ST software online, but that is about it for 16-Bit.

As for the TI, I thought the 4A was 8-Bit? At least externally, maybe internally it was a hybrid 16-Bit system?

This is a complete and total shame. Jinnee is awesome. But alas I
figured might as well start somewhere like Teradesk because getting Jinnee
source/rights is probably an uphill battle.

Thanks,
Mark

>> Question: Do I need a special Midi cable for the Midi Out on my Mega?

To be safe, yes. You should get the MIDI cables that have all 5 pins connected individually (i.e. pin 1 connected to pin 1, etc at each end). As stated already, some cheaper cables have 2 pins shorted which conflicts with the MIDI Thru. You can't be sure unless you test it with a multimeter.

These types of cables usually cost a little more and have shiny silver metal enclosures around the plugs instead of plastic. Look for them at the better music stores. I use Rapco brand cables. Hosa does not make these high end cables.

Or just because it *can* be done:)

Doing a project for real profit on the Atari is counterproductive in
many ways. For most projects to be profitable in such a small market,
the unit prices have to be so high that no one could afford to buy
them anyway, making it a self defeating enterprise. For the Atari
platofmr, the way forward really is co-operative non-commercial
projects. I agree with paying for products, paticularly hardware, but
from a development point of view doing it for *serious* profit doesn't
really work, paticularly software.

> internally it was a hybrid 16-Bit system?
>

The TI was the first commercially available 16-bit to the consumer.
The 9900 is a 16-bit microprocessor, with separate address and data
bus. 16-bit address bus (MSB is used to determine even or odd byte)
allowing it to address 64k, byte addressable. 16-bit data bus. In the
99/4A, this is muxed to an 8-bit data bus outside the console for use
with 8-bit peripherals (not unlike the first PCs - in this case more
like an 8086 than an 8088 which was 8-bit at the processor
connection.)

The instruction set has 16-bit registers and hardware multiply/divide
(unsigned).

Ben

I actually have Hatari setup on my Mandrake Linux box(s) and it works
pretty well. I have to admit though...its just not the same as actually
playing the games in original form on my my Mega ST... :-)

Hi Mike,
I know this must sound silly, but i have not had chance to open my
'standard Falcon' yet..

but i just wanted to know the RAM setup for this Falcon..

It's showing 4MB, is this just one simm, clipped on to a RAM card?
Can i upgrade the memory without buying an additional RAM card?
what simms are they ?
i have a load of old simms and i am wondering if i could just replace
the original one with a bigger one...

oh and BTW i used to own a RD350 LC MkII (ypvs) and i know about keeping
motorcycle spares.....

kind regards

It really surprises me how much a number of users bitch about the
smallest "infraction" of usenet "rules" but hold their tongues about
Bravo Sierra. This guy is habitual. Always the same line of commercial
crap. I say, may Bravo Sierra go Tamgo Uniform. Soon.

Have a nice day.

You'd be surprised how many don't know how to use the "Block Sender" option.

Pictures are posted on my website at home.earthlink.net/~rdf0013/

I am selling off all my older collections as I need storage space and
rarely use these anymore. I can be reached at gathermore2003@yahoo.com
if anyone is interested.
All items are in great working order and have been taken very good
care of since I was (am) a huge Atari fan. If purchased I can ship COD
with insurance. I am located in Sunnyvale CA...

Thanks

Atari Portfolio
1 - Atari 12 digit folding solar calculator
1 - Atari Portfolio
1 - Atari leather case for portfolio
1 - 128k portfolio memory card
2 - 64k portfolio memory card
1 - Timekeeper program card
1 - File manager program card
1 - Smart parallel interface for portfolio
1 - PC Card drive, portfolio memory card reader
CD with portfolio software I have collected over the years
* All manuals included

Atari Jaguar
3 - Atari Jaguar 64-bit system (2 working and 1 not working)
1 - Atari Jaguar CD
1 - Memory Track Cartridge
1 - ICD Catbox
2 - Atari Jaguar controllers
3 - Atari Jaguar power supplies
1 - Jaguar composite cable
1 - Jaguar S-video cable
2 - Jaguar team-tap
1 - Jaguar jaglink kit
3 - Video RF adapters

33 game cartridge (Tempest 2000, Power Drive Rally, Checkered Flag,
Attack of the Mutant Penguins, Val D'Isere Skiing and Snowboarding,
I-war, Cybermorph (x2), Ruiner Pinball, White men can't jump, Fight
for Life, Pinball Fantasies, Dino Dudes (x2), Ultra Vortek,
Alien vs Predator, Hover Strike, Wolfenstien 3D, Syndicate, Doom,
Missle Command 3D, Kasumi Ninja, Flashback, Iron Soldier 2,
Trevor McFur in the Cresent Galaxy (x2), Iron Soldier, Zool 2,
Defender 2000, Raiden, Supercross 3D, Flip Out, Brutal Sports
Football)

7 game CD (Myst, Space Ace, Highlander, Vid Grid, Battlemorph, Blue Lightning, Myst demo)

* Includes manuals, controller overlays, posters, jaguar promotional items, Atari 2600 cartridges, Atari cartridge cases, Atari Comic books, Atari 7800 cartridges and Atari trackball controller.

Atari Lynx
1 - Atari Lynx System 2
1 - Lynx large carry/storage case
2 - Lynx small carry case with cartridge pockets
2 - Lynx sunvisors for lynx 2
3 - lynx system link cable
2 - AC power adapter for Lynx
1 - Sony headphones
1 - Lynx battery pack (6 D-cell portable pack)
* Lynx documents, game manuals, lynx magazines and promo docs

32 game cartridges (Baseball Hereos, Batman Returns, Dracula the Undead, Gates of Zendocon (x2), Todd's Adventure in Slime World (x2), Block Out, Gauntlet, Raiden prototype card, Hydra, Checkered Flag, Tournament Cyberball, Rygar, Hockey, Steel Talons (x2), Zalor Mercenary (x2), Road Blasters, Rampart, Pit Fighter, Ms Pac-man, Xybots, Warbirds, Shanghai, Qix, Paperboy, Vicking Child, Pinball Jam, Shadow of the Beast, Robotron 2084)

6079. HELP !!! HARD DRIVE BOOT PROBLEM!!

Newsgroup: comp.sys.atari.st
Date: 2004-11-28 01:12:35 UTC
From: Atari-Korps <news@atari-korps.com>
Message-ID: <cob8m3$pk5$1@hercules.btinternet.com>
Source record: 15874

Hi,
I have just been playing around with my Falcon,

first I formatted the 120MB IDE drive... no problem...
then I tried to add a SCSI driver on the C:\ root dir...
this had the affect of locking up the boot sequence..
and now it bombs out before I get a chance to change anything..

how can I get the Falcon to boot from the floppy?
and ignore the hard drive....

any help gratefully received....

6080. Re: C-Lab Falcon MK X Photos

Source record: 15875

cheers for the info.....

the RAM card I am looking at buying is 14MB....
I think it will do the trick....

my main problem now is....

I have stuffed up my hard drive!!! I can't get it to boot properly..
how can I get the Falcon to boot from the floppy only?

kind regards

looks like i found out how to overide the boot sector?!

i pressed a combination of 'control'+'shif'+'spacebar'
i don't know what it did...
but i can now re-install the HDD !!

6083. Atari-source Name Change?

Newsgroup: comp.sys.atari.st
Date: 2004-11-28 06:04:17 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2004.11.28.06.04.17.268276@nosspamatari-source.com>
Source record: 15878

Hello everyone,

In less than 24 hours I want to make a decision on something. I've decided that I'd like to change the name of the atari-source.com web portal to something more appropriate.

I don't control the atari-source.com domain hence I can't use that A record for atari-source.com alone or www. I have the "portal" subdomain which in all honesty kind of sucks.. I'd like to get google ads and everything else and I cannot do these things.

So with that said my options are:
1) Keep it the same as it is now. Use portal.atari-source.com forever.
2) Buy atari-source.org or .net and use that as the portal
3) Buy atarionline.org or .net and use that for the portal thereby renaming the site.

What's everyone think? I mean.. The reader's opinion is what really matters.

Thanks,
Mark

Hi all,

I have a EZdrive, looks to take 120MB discs, I have 2 or 3 of those disks, drive looks like new, not been used for about 3 million years and not even sure how to plug it in to test it, but when I get around to it I will probably bung it on Ebay, anyone got any ideas how much these things are worth these days ?

Cheers,
Chris

6085. HD FORMATTING PROBLEM

Newsgroup: comp.sys.atari.st
Date: 2004-11-28 12:12:11 UTC
From: amentothat@ukonline.co.uk
Message-ID: <d477b83c.0411280412.ee18b6f@posting.google.com>

Just aquired a "Third Coast" Hard drive with ICD controller and Seagate 65mb drive in it. Unfortunately no Hard Disk utilities were included. The hard drive is in need of reformatting - I have tried software from my collection - VORTEX HD ULTILS & ATARI HDX, neither will format this drive (HDX tells me to check connections! OR to reformat when trying to re-partition because the drive has been formated with an earlier version of HDX), the version of HDX I have tried is 5.04.

I have searched the internet for Hard Disk tools for the ST, but, cannot find any. Any links to a program or suggests would be very welcome.

Also, how does one convert an ST IMAGE file back to its original ST File format?

As far as I know they are one company but still use both brand names.
A lot of their networking things are still branded as US-R but you
seee a lot fo 3COM things too. They are both recognised brands so I
guess it's good business sence to keep them both.

For the sake of identity I'd reccomend keeping the atari-source name
with the .org or .net domain so you have more control than now. having
ad's (from a site visitors point of view) sucks but it does give you
revenue, which would offset the costs to some degree.

6092. [WEB] Eiffel 1.10 update

Newsgroup: comp.sys.atari.st
Date: 2004-11-28 16:50:31 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1gnz2kn.1jegg0hal5jy8N%NOSPAMS@wanadoo.fr>
Source record: 15886

Hi,

Eiffel Atari PS/2 interface (and more) arrive again in a new update:

* Add IKBD_LCD command for lot of fun user features. Thre are an example
on my site with LCD.SLB used by Aniplayer 2.23 but there are others
examples inside the archive.
* The Eiffel clock can work by interrupts (better precision) but this
feature need to reprogram the PIC (eiffel_i.hex, v1.10i). So it's also
possible to use the version without interrupts (eiffel.hex).
* New boot loader in Flash with LCD display.
* Fix AltGr or Shift state if the AltGr/Shift(s) keys are released
before the key.

The HYP is also updated.

Regards,

Didier.

Sounds like the Syquest EZ135. If its the SCSI version maybe someone
could use in their ST/TT as a cheap 128mb drive, but theyre not very
reliable. ï¿½10 at most.

Coda.

> using Graphics cards are such a small percentage it would hardly be
> profitable for any authour to implement.

Just a few things to say about this point of view...

1. You can also get Truecolor graphics on a standard Falcon (albeit slowly). You've also got some Hades, Milan, and other clone users. You've got Emulator users, including this big push for Aranym to get going. So what if most Atari users are still stuck on their mid-80's machines? Newer machines *have* been made, and still need support. At least give people the option, then they can decide whether they want to use it or not.

2. You could also use the same logic to say, "What's the point of making Atari software in the first place, since there are such a relatively small number of people using Atari's compared to PC's?" If the number of people using a certain type of machine is such a big consideration, why are we still even here? It's because we enjoy what our little machines *can* do. The coolest thing to me about this Atari community is that if we want something done, we do it. We don't have to have a Microsoft guy saying, "No, you can't do it that way, because it doesn't fit with our ideals." So why put down the idea of letting the people with newer little machines enjoy what they *can* do? Does it not fit with *your* ideals?

3. For the people who actually own the more high-end machine, in light of this comment, they would have to begin to ask themselves why they so horribly wasted their money if the attitude of the Atari community is like this, and doesn't support them with software that is capable of making use of the more advanced features in their machines. If you expect a Falcon, Hades, Milan, or Emulator user to be stuck with basic (boring?) ST-feature-only software, they might as well give up, sell their Atari compatible, and use a PC or Mac. At least it would look nice, even if it doesn't work the way they like it.

4. Basically, cost aside, it's this kind of attitude that's pushed people away from this platform for a long time. You're basically saying, "You want to do more with your machine? Well, screw that idea. I'm not interested because *my* computer can't make use of that, or I'm not interested in that kind of thing." In such a small community of users, alienating even a few fringe power users can be disasterous. They're generally the ones pushing the community forward, creating

that little bit of demand for more powerful software and hardware that gets new things happening around here, and in many cases they're the ones actually making the new hardware and software. If they go away, so does any real amount of future advancement on the platform.

5. If your computer can't perform every function that a piece of software can accomodate (especially if the software adjusts for your machine's features anyway), don't kill the software, or software idea! Use it as it is, with the machine you've got, or get a higher-powered machine. Don't put down discussion that could actually advance our machines, making our Atari's just that much more fun, just because you or others won't be able to use it. The only waste of time here is discussion about what we *shouldn't* do. Any discussion about what's possible, even if only for a relative few, is active advancement and well worth our time.

... my 2 cents.

This is probably the guy who wrote on the atari-source portal about how a new sparemint website is a giant waste of time... Completely missing the point entirely. Sounds like someone is just ticked off he can't afford an atari with good video ;-) Do yourself a favor and setup ARAnym and see just how great it is. It's a great way of seeing what it's like to use high powered atari hardware.

Thanks,
Mark

> GFA. Such situations are quite frustrating.

In a situation like that you could just release it anonymously and see what happens ;-) If the author is MIA do they *really* care about their copyright? I don't understand how anybody can be that greedy. Consider another situation where the author wants to release but has other people's rights tied up in the code - but can't find those people. Again..... Situations like this I'd just anonymously release it as GPL. Maybe I'm immoral for that, but I bet you in 90% of cases, nobody with any interest in the program being released would even notice. I know people should just do the work themselves in GPL to begin with, but something like Jinnee has a LOT of code behind it and it's a shame to duplicate all that work, especially when it's already done properly.

Thanks,
Mark

Driver is not the problem - its a programme to format the drive with that I need.

Source record: 15806

Ahem...The two things mentioned, and some others, such as CBHD, can all
format what they drive. There is really no substitute for getting a
likely file and seeing what it does.

If it has an ICD controller, at least it used to be true that the ICD web
site had ICD Tools (two formatters, a boot program, a driver program, and
a whole bunch of other things) downloadable from the website.

However, the details you mentioned suggest that the drive you have
was dead on arrival, and that formatting will not fix it. Either the
drive is not responding to the controller, or the controller is not
working, or you really do need to check some connections.

Jim

6113. TeraDesk 3.42 released

Newsgroup: comp.sys.atari.st
Date: 2004-11-29 19:46:34 UTC
From: vdjole@EUnet.yu
Message-ID: <cofuaondn1@news.eunet.yu>
Source record: 15808

Version 3.42 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a non-critical code-optimisation release; program size has been
reduced a bit, there is an improvement in speed of some operations,
and several small corrections/improvements were made which were overlooked
in the last release, and should be mostly invisible to the user.
See the history file for details.

Have fun.

> worth these days ?
>
The Syquest EZ135 is a 135MB removable (cartridge-based) hard drive.
I own two and use them on my Falcons.

Reliability is not as good as a sealed hard drive since the drive
heads are not sealed. However, in a pet-free, smoke-free home they
are usually satisfactory.

I've been using the EZ135 as storage for the never-ending scanning of
old photos I do prior to putting them on CD-R. Two (of eight in use)
cartridges have failed in six years. (Come to think of it, all my
failures were in the first two years.)

The drive plugs in as does any normal HD. It's value is probably
similar to a 135MB SCSI HD, which is to say not much.

Galen

Well said:)

Also I think if you look at the way the Atari community is now, I
think you would ifnd a fair proportion of people have a higher end
system, be it a Falcon or clone, or simply an upgraded older system,
paticularly in Europe were the Flacon was more sucessful, and where
the clones were built.

Hi all,

I have 2 STE's both with the same problem, and thats theres no databus comming from U401 to the RAM area, all address bus and all the ras/cas lines are fine but no databus at all. I've changed the big IC 401, which is called GSTSHFTR 3 times, it has clock input and power, but appart from that im out of ideas, ive also changed the CPU and blitter just in case. only IC left is the sufrace mount big un, I assume its to blame but can't prove it, also out of ideas. looks like a scrapper :(

TIA
chris

Bonsoir :)

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> troll11b_uk.zip (130KB)

Fixes:
- crash if NVDI (or any other GDOS compatible) was missing.
- in the internal editor:
- crash if delete at line end, on the last line.
- bad position for block paste
- unwanted scroll when text is smaller than the window and cursor at end
- Adds in this documentation

Voilï¿½ :)

Have you tried replacement simms, or at least swapping your about to
eliminate a faulty device.

Where in the world are you?

6135. HD disk drive circuit (with GAL) uploaded

Newsgroup: comp.sys.atari.st
Date: 2004-11-30 22:45:38 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <41acf80e$1@news.broadpark.no>
Source record: 15829

Thanks to the author of a previously commercial product saying yes to my
plea for releasing it freely, I have now uploaded a HD/DD circuit using
a pre-programmed GAL chip and added some English translations etc.
(this allows the Atari ST to use a high density floppy disk drive, so it
can handle both DD (720 Kb) and HD (1.44 Mb) floppy disks.

I'd like to build it myself, but don't have enough electronics knowledge
to fully understand it myself yet, nor a great deal of understanding
German, so perhaps we can get some discussions going on about it here...

Anyway, the file is ready for download from here:

ftp://gem.win.co.nz/hall/hardware/hd_2004.zip

Simms are tested on another machine, but is somewhat irrelivent since there
is no drive to the ram databus, rather confusing, I prefer the STFM, at
least you could change more chips!

Pretty self-explanatory.... Easymint. Hardest part about it is making
sure you have a properly setup RAW partition. Follow the documentation
and use HD-Driver to do this.

Thanks,
Mark

(All you Mint users - if I've got something wrong, don't hesitate to jump
right in and correct me!) :-)

Sam, its like Mark said - Easymint is the way to go. Go to the easymint
website:

http://atari.st-katharina-apotheke.de/home.php?seite=0&lang=en&headline=Home&texte=news

and download all the files you need (there are also some good help files):

EM_152.ZIP
LST.ZIP
BASIC.TAR
STANDARD.TAR
NET.TA
DEVEL.TAR
LIBS.TAR
ENGLISH.ZIP

Extract EM_152.ZIP
Extract LST.ZIP

Put the TARS and LST files in /easymint/pakete.

Use HDDriver to make a partition that Mint can use. If its an older
version (like mine, v7.61) then you have to give it a "LNX" partition ID.
My understanding is that newer versions will do this step automatically.

Run EASYMINT.PRG and it should install itself.

During the installation, easymint will reboot a few times - this is normal
don't worry about it. Most of the prompts are explanatory (sort of).

Don't be surprised when its done. More than likely you're going to wind up
at a white screen with black text and a shell/command line prompt.

From there, you can edit C:\MINT\MINT.CNF to make it do pretty well what you want. (Hint: You can edit this file from TOS or Mint - just remember that whatever editor you use must have *no* carriage returns/linefeeds)

You'll really need to install a multitasking AES like N.AES or XXAES or MYAES. A good replacement desktop like Thing is highly recommended as well.

I purchased N.AES from Woller Systems in Germany, but man...its not easy. They don't take credit cards, etc, etc, so I wound up paying by Western Union and altogether - its not cheap.

Just remember, that until you do get all the "accessory" software in place, and everything configured for Mint, you can simply go into your AUTO folder and rename MINT030.PRG to MINT030.PRX, and your Falcon will boot back up into the ever familiar TOS desktop. You can move into the AUTO directory while in Mint or you can hold down the key that bypasses AUTO folder program, go into C:\AUTO and rename MINT030.PRG :-)

Sam, if you have any problems or questions (you will! <grin>), post them here and somebody will jump in and help you.

Have fun! :-)

6142. CT60/Ram problem?

Newsgroup: comp.sys.atari.st
Date: 2004-12-01 02:34:54 UTC
From: "Ronald J. Hall" <darklord@darkforce.ky.org>
Message-ID: <pan.2004.10.29.22.18.44.580876@darkforce.ky.org>
Source record: 15836

Well, I think I'm experiencing the inferior RAM card/SIMM problem with my CT60 equipped Falcon.

Running in '030 mode, the Thing desktop, 640x480-256 colors, looks great. No problems.

Running with the CT60 on, same setup, I get fuzzy, funny colors along the top edges of all icons, desktop and window.

Running with the CT60 on, same setup, and Thing running under MINT/N.aes 2.0, I get the same effect, plus a pixel block left in the menus whenever the mouse is there. Also, the mouse pointer starts out invisible, and once I move it, it becomes visible again. Its unstable as well - I can go to Configuration under Thing, and Thing immediatly crashes back to N.aes.

Is there a definitive way of telling whether its the SIMM or not? I've got a stock 4 meg Atari memory board, and a Wizztronics 14 meg board. It does this with both.

I do get a "keyboard" failure message with every boot up with the CT60. I'm using the DEKA interface.

I'm using 60ns, 2 cls, 256 meg ram, by Crucial in the CT60, and this is with the "no solder" installation. Temp is staying around 32C, so I don't think thats a problem.

Thanks in advance.

What type of ram do you have in the Wizztronics card? I had Fastpage ram
in my CT2 machine, and found the same fault. Then I tried EDO and
problem solved.

Mark

Ronald,

Almost definitely the problem is not the CT60. I know you don't have the
solders installation yet so this is actually really bad. I've never heard
of anyone getting display artifacts with standard bus speeds. When you
ship your falcon to me I can try different SIMMS in the Wizztronics board.

Thanks,
Mark

I'm very puzzled. This is a very *old* post. I put this post up something
like last month?

Its already been solved too...as many pointed out, I had NVDI disabled in
my AUTO folder when I was trying to solve various problems when I first
installed my CT60.

After I activated NVDI again, all was fine.

I'm still really, really confused by this post showing up again.

Anyone have any ideas? I use Pan under Mandrake Linux.

The Connection between America and Atari (just incase some of you think that this is getting way too political) is that Atari was ORIGINALLY an American company/registered company, started up by Nolan Bushnell (an American from Utah I believe)... this was until the french (in the shape of infogrammes) managed to get their dirty digits on the much beloved Atari

Additionally i'm pretty sure that before he started 'living in a bottle' even your Mr Bush liked to play on his Atari (a closet Atari fan perhaps)

And before you Americans started falling in love with that JAP CRAP (Sega, Nintendo, Sony etc), wasn't America's premier Videogame company/product/brand called Atari

Are you using the F030 boost on the CT60? If so what speed are you
clocking the mobo at? If you get these problems with the boost turned
off then its probably not your RAM, I would suspect a faulty videl
chip. Ask Rodolphe, he should know straight away.

The keyboard failure message is irrelevant. I and many others get it
also.

Coda.

From: exxos <exxos@home.co.uk>
Message-ID: <41addf27$0$19157$cc9e4d1f@news-text.dial.pipex.com>
Source record: 15847

Hi all,

I had a old STFM and a working STF, so I spent most of the afternoon swapping over the RF modulator box, plus lots of bits under the tin can (shifter box) plus a few other bits here and there, and the scart has now stopped working, both RF and scart display picture but there seems to be no H or V sync, I've scoped them out and there looks to be pulses there so dunno whats going on.

Has anyone tried such a mod and got it to work ? I've probably missed something though can't see anything else which it might be :(

Cheers,
Chris

Argh. I don't know what happened Coda, but this post is a repeat from 1-2 months ago. I'm completely at a loss as to how it appeared in this newsgroup again. I did not send it again.

The culprit turned out to be NVDI. I had it disabled in my AUTO folder when I was trying to track down various problems when I first installed my CT60. Once I re-enabled it, everything was fine.

I'm using Pan under Mandrake Linux - anyone have any ideas why an older message like this would pop up? Thanks.

I've not tried the latest version of Teradesk. I do have the last release
of Geneva/Neodesk (and its very good). In my humble opinion, Thing is the
best I've used. I think a lot of Atarians feel that way as well. :-)

I don't see the point in trying this, as you are in the UK and TV sets
there usually - AFAIK - have SCART (Euro AV) connectors. I'd advise your
to build a SCART cable instead, as the results of the Atari's RGB output
are sharp and clear while those of the RF modulator always are of very
low quality (blurry and unstable).

I've had 2 for some years, and though not used that much (except for backups) I have not had any reliability problems (touch wood!). They are certainly better built than the ZIP-drive, which did lack reliability according to reports. The only drawback is that awkward ejection (which they improved on the later EZ230).

Price you quote is about right - I bought 2 more with 10 carts for just 20 UKP from a fellow club member, as standbys.

I use one connected to a USB-SCSI adapter on my son's PC for downloading files etc from the web (easier and faster than on the Atari Falcon) and then just have to move the cart over to the drive hanging off my Falcon.

Regards, /Peter/

Hi Nick,

I was just curious. I'm letting my family know that I want a 2 yr
subscription, starting with issue 132(?) as my Christmas present. :)

BTW, about how long do you suppose it would take for an issue to reach me here
in Virginia?

Thanks,

Sam F.

Easymint will need to be customized to get this configuration for you.
It'll probably install an older kernel and no aes (login prompt instead)
there you can learn about the system and customize it. A linux
background helps.

Thanks,
Mark

its a SCSI 135, ive got it hooked to me falcon copying me HD to it,
hopefully I can get a old SCSI card for me PC so I can access the drive
there, then I can finally get the stuff off me falcon to me PC! I've given
up trying to get my LAN to work again, so using this drive might just do the
job!

cheers

> Mark,
> Easymint is kind of an installer for mint correct? So, I can use easymint to
> install 1.16.1 and MyAes?

Wrong.
Easymint is a distribution based on the SpareMiNT projects.

1. What is MiNT?
MiNT is a preemptive multi-tasking kernal initally designed for 16bit
atari machines. It tries to be as 'posix' compliant as possible,
therefore it is targeted ultimately to be kernel for a 'unix'
workstaion. You don't necissarily have to install or use anything
Unix to get benifits from a MiNT kernel. Since you asked about
EasyMiNT however...please read on.

If you've no idea what unix is and intend to try out EasyMiNT, then I
suggest you use your favorite search engine to read the basic overview
on what unix is before you go any further here.

While you are studying, find some quick cheats on the net that will
teach you basics (print your favorite screen based text editor's
manual out...it'll really come in handy) on the following shells and a
text editors.

Shells: sh, tcsh, bash
Common Screen Based Text Editors: pico, vi, emacs.

2. What is a shell?
In the unix world...a shell is your basic command prompt, or user
interface. EasyMiNT comes with a variety of shells you can use
ultimately...tho' early on it is going to use the smallest and
simplest one out there...called sh. Remember, alot of Atari machines
max out at 4meg of memory :)

3. What is SpareMint?
Think of SpareMiNT as a public library where you can go to check out
books (rpm files). With the proper password, you can even change or
add new books to this library to share with the SpareMiNT community.

SpareMiNT is a project where kernels, drivers, utilities, etc...that
have been, or are supported for MiNT are collected (when it is legal
to do so) in the form of source and binary installable-distributions
(we call a distribution an rpm, and sometimes less smart distributions
come in something called tar-balls). As a user, you can download the
latest ports of various MiNT/unix utilities in source and or binary

form (again, via rpm or tar file), install them, and have a neat little log of what you've done during installation and since. If you do any coding yourself...you can upload your bug reports/fixes, notes, changes, additions, etc...to the SpareMiNT project. In essence....SpareMiNT is a support community.

4. What is EasyMiNT?
It is a distribution with some instructions, tutorials, scripts and the necissary binaries to get you started with a unix work station based on MiNT. Most if not all of this package is based on the SpareMiNT project. Note, there are some portions of a full MiNT setup that might not be included in the EasyMiNT distribution for legal reasons...but EasyMiNT is very good about providing directions that may tell you where and how to obtain these 'optional bits'.

5. In English please! What does EasyMiNT do for me?
EasyMiNT, first will give you some documents to READ, and some things to do manually to prepare your system for installation of a unix workstaion. Then, it will walk you through a series of prompted questions which basically do the following:

a. Prepare the hard disk partition for the unix side of your installation.
b. Set up some basic things like your hostname, root password, timezone, superuser account, etc....
c. Untar the distribution and put the relevant files and programs in the proper file-system.

The most tricky part of getting a unix workstation going are the various options, loggers, and servers you want started and configured during the 'boot' process. These files are going to be found in the /etc/ directory on your new unix partition. EasyMiNT takes most of the nighmare out of working with these numerious configuration files and scripts. EasyMiNT provides very solid groundwork here...and most of the etc files are well documented so you can figure things out as you need them.

EasyMiNT has different 'parts'. You can install one, two, or all of those you feel you will need. (Given you have a high end system...I recommend grabbing everything available and installing it all in the beginning.)

The 'Basic' setup, will set up your hard disk partition and install the general utilities needed to work with the file system, edit text files, and launch binaries. Examples are...your command prompt shells, commands like cd (change directory), ls (list files), rm (delete a file), ln (make a symbolic link for a file), more (read a text file), and so on. You're also likely to get a variety of standard tools for dealing with text files, email (on disk anyways), and newsgroups.

The "MiNT-NET" part of the package installs the networking bits. If you intend to go online at all you'll need this. Obviously, if you're building a computer network...you'll need this.

The "Compiler" option installs compilers and libaries for making or porting in your own code (many unix utilities are distributed in source form only...with a simple install script that checks out your OS, system, etc...and attempts to compile what you need jonny on the spot). As the development of MiNT and the various compilier libraries progress...you'll find more and more unix (platform independent) packages that compile and WORK with no atari specific tweaks/changes at all! If you have a TT, Falcon, or other Atari that's pretty zippy on speed and can take extra memory....definately grab this! If you're installing to a low end machine with low memory conditions...well...it's best to find precompiled versions of utilities/applications in my opinion.

There might also be packages you can add on such as Xwin 11, which is a Graphical User Interface for unix workstations. If you've got the drive space....might as well go ahead and get it :)

6. Do I need a multitasking aware GEM/AES?
I highly recommend it. XAES, MyAES, N_AES, and Geneva are examples. In general, you set up your preferred GEM/AES according to its instructions.
Boot your system...log in as superuser, and launch the aes you intend to use from the login shell. The same applies for your choice of desktop (TaraDesk, Thing, Jeenie, etc).

Hope this helps a bit....
Brian

What is required at the SCART end ? I've heard some people say you need
certain bits of circuitry. If you buy a SCART cable it hasn't got any.

I already made my own scart cable years ago, it can be a little odd to wire it up, though the TV im using dont work to well on scart, text ends up like S shaped at the edges and all kinda of odd thing, but when you goto the desktop everything if fine. but anyway, my point is it something which *should* work to fit RF, I know its more fuzzy, it really don't bother me for what I use it for, though its more readable on the TV set than scart is thats for sure!

Brian,

Thats a good post there, but I gotta mention the one thing that has been overlooked, and that is that you can have a MiNT setup without having to have a Unix partition/unix tools installed. Sure you lose some power and a lot of benefits that way, but maybe Sam F just wants to have the benfits of a fast mutlitasking OS, without the "scaryness" and complexities of a unix console (especially if he has no unix experience at all). He mentions wanting to run MyAes and Thing, which is so easy to do if he just gets the new 1-16-1 FreeMint kernel (which now comes with XAAES as a kernel module (Much improved!)) then he can add MyAes and Thing at a later date. I am testing the latest Teradesk, which is free, and it is getting better all the time.

regards,
Coda.

6173. Atari SF354 drives and Atari ST (not FM)

From: Ian McCall <ian@eruvia.org>
Message-ID: <318cemF37oupsU1@individual.net>
Source record: 15766

Hi.

I've come into possession of two SF354 drives and an original Atari ST.
Trouble is, there are no power cables or connecting cables for any of it.

Are these easy and cheap to get hold of (in the UK)? The whole lot is likely
to be eBay'd off anyway because I have an STe with hard drive, but it will
probably be easy to do so if I have the right leads to go with it.

Cheers,
Ian

Hi Everybody!!
Does anyone know of any free ide cd drivers? I need one so I can install Mint on my hdd. I will be getting Extendos Gold for Christmas (I hope), but I'd like to experiment with Mint before then.

Thanks,

Sam F.

Using Google I just found this link (there may be more and/or easier
solutions, just too lazy to look now):

<http://www.howell1964.freeserve.co.uk/Atari/ST/Atari_ST_Video.htm>

And if you want to avoid the hassle of soldering - finding an Atari ST
monitor plug nowadays may become a real PITA - there's a guy in Poland
regularly offering these leads at eBay UK (he ships worldwide).

Or just ask <mailto:christian@bontenackels.de> if he ships worldwide, he
has some "new" old stock for sale (EUR 5.00 each).

So has anyone taken a look and figured out the details (where to connect what, which traces to cut, wires to connect together etc)?

Once I get this thing built and it works I'll probably create an easy to understand step-by-step "how to" text file to add to it all.

Neh, I build me own had have done since around 1996, with the demise of 720K floppys (most manufactures opted out a couple of months ago) there is no use in hyperformating a 720k, mightaswell use 1.44 and get some extra space. If you only want 1.44 access then just cut the clock pin of the floppy controller and connect to the 16mhz clock on the shifter, add your modded floppy drive in and there you have it. Wont read 720K anymore, but oh well :))

Ah yeah, 32mhz, was for 2.88 ? Never seen much of those about TBH, I think
they were expensive! I also see the ED format offering 4MB, very expensive,
if there was call enough id add it to me HD module, though going by ive only
sold 4 over the last couple of weeks dont seem worth the trouble ;-)

You may have messed up the impedance matching of the video signal, make sure you've put in all required components, somewhere will be an impedance matching load, probably of 75 ohms or near or the video amp is failed.

I dunno whats going on, I put in the RF circuit, that messed up the scart
syncs, then after looking at the diagram, there was a bunch of other stuff
around the shifter, to which I added in , and it didnt change a thing.
Still rather annoying, but its one of things I wanted to know "could it be
done" for a while now. The picture is there, and its in the correct
colours, just missing a sync or 2 somewhere, actually I think those 3
resistors and trasistor which I cut out to fit the RF can might have been
the route of the problem, will have to look into that and put them back in
and see if the scart comes back to life.

This lib is only the standard libjpeg converted to SLB.. nothing related
to the DSP inside.. and I don't want to use the SLB system.

A lot of us need to use HD *and* DD disks for compatibilty issues with
other equipment, and personally I don't care about the hyperformat
option as it's not much to talk about these days anyway.
If you want to store a lot of data you'd use a ZIP drive or a CD-ROM.

I'm opting for this circuit, or the one by Michael Schwingen
(http://www.ccac.rwth-aachen.de/~michaels/index.php/hardware) as they
use GALs for the step rate stuff.

By the way, does anyone know of companies/individuals etching PCBs out
of circuit trace layouts as enclosed with the project?

Bullshit.

Have you ever read the first amendment?

The First Amendment concerns GOVERNMENTAL efforts to control speech.
GOVERNMENTAL prior restraint.

The First Amendment has nothing to do with the crap spewed by Atari boy on
this forum and the efforts of private citizens such as the users pissed by
the never-ending spam to stop Atari boy from continuing to spam.

If you insist on playing a constitutional scholar in this forum, at least
take the time to read and understand what that portion of the Constitution
you cite to actually says.

6207. Problem Encountered while Re-boxing Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-12-03 17:06:02 UTC
From: Derek Mark Edding <dreq@earthlink.net>
Message-ID: <_11sd.2696$Va5.1505@newsread3.news.atl.earthlink.net>
Source record: 15703

Hi Folks,

I've transplanted my Falcon 030 into a Falcon Rack case (Wizztronics).

Everything seems to be functional except for the floppy and hard drives. It boots, lights the display, passes the memory test, and then displays a low res desktop.

I can hear it attempt to read the internal IDE drive, but the only disk icons that are displayed are Floppy Disk A & B.

During bootup, I see the floppy drive's light come on when it tries to read the disk. When I put a known-good floppy in the floppy drive and double-click Floppy Drive A, it tries to read it, then I get a popup that says "Data on the disk in Drive A may be damaged" "Cancel" "Retry".

I've tried reading other floppy disks, and even swapping out the floppy drive. It made no difference.

This system has an internal IDE drive with four partitions. It also has an external SCSI drive bay with two hard disks.

At bootup, I can hear it attempt to register the internal IDE drive. During the memory check the IDE drive makes a series of clicks. It does it once more after bootup.

I also tried swapping the internal IDE drive with an older one that was set up for a Falcon 030. It was not able to read that drive either.

I can see from the lights on the SCSI drives that it's trying to read them too, but somehow it's failing.

I tried disconnecting the SCSI drives and the IDE drive. It was still not able to read a floppy disk.

I've examined all of the motherboard cables and connectors and they look fine. I tried reseating the few socketed ICs, no help.

I also tried removing everything from the case including the motherboard, and reinstalling everything a second time. This had no effect.

I called Wizztronics for advice but got their answering machine. I plan to try again in a while.

Anyone have a guess what I've munged here?

Thanks!

-dreq

Are you using the falcon's original floppy drive or a pc's floppy drive? If so, the pc's fdd must be jumpered so that the falcon can recognize it as device 0.

As for your hard drive, run hddriver and see if it can find and recognize/configure your drive.

Hello Sam,

All of the drives are from the original, fully operational Falcon 030
system. It was reading them last week.

The re-boxed system has not been able to read two different known-good
IDE hard drives, nor the SCSI drives that it was able to read before. I
don't think hddriver is the solution.

Any other ideas?

Thanks.

Hi Derek. Sam and I both have the Wizztronics case and everything works here so I don't believe that the case itself is the problem. I hate to ask, but are you sure that you have the floppy and IDE cables plugged in the right way? I know for sure that the floppy will give error msgs like you describe, if the cable is reversed. Make sure you have the red pin 1 orientation correct.

HTHs.

PS BTW, isn't that an awesome case? :-)

As soon as I get my greedy little fingers...er, a chance to read them,
I'll be happy to offer feedback.

Gosh, its just been so long since I've even got to read a real Atari
publication! I've been pulling out my old collection of Atari Explorer
mags and re-reading them. Man, what memories! :-)

Message-ID: <2d3sd.2482$714.1652@newsread2.news.atl.earthlink.net>
Source record: 15710

Hi Ronald (& Sam, from previous post),

I've just about ruled out any of the easy mistakes.

Before removing the ribbon cables from the floppy and IDE HD, I marked them with "TOP" on the upper sides. I've checked all of the cables and don't believe there's a problem with the way the connectors are aligned.

There's also the fact that the drives are functioning more or less correctly. The floppy drive's light comes on at the right time, and you can hear it turning. There's a click when the head engages. It's just not able to read anything. The behavior of the IDE and SCSI drives are very similar - they spin up and attempt to read but fail.

I'm certainly not blaming Wizztronics, I took care not to mention their name in the subject line. The case seems fine.

I'm starting to wonder if this Falcon has seen its last days. I have a backup unit socked away in case this one dies, but I'd rather not take it apart if this one can be salvaged.

Thanks all.

-dreq

If you can't get a SCSI card, you may want to try the Adaptec
USBXchange which plugs into any USB port on the PC. A little pricey
- I paid 65 UKP for mine at Mikro Anvika in London's Tottenham
Court Road.

Derek, how did you get the Falcons floppy cable over to the new position that the floppy is in, in the Wizztronics case? I had to use an extender cable. First time I hooked it up, I got it backwards. Could it be something like that? (I know, that doesn't explain your hard drive).

Did you leave the bottom sheilding on the Falcon. I did, I was afraid of something grounding/shorting out. Any chance it could be something like that? (although I'd expect diff results if it was). Just a random thought there.

Heh. If this was an ST, I'd recommend that you pick it up 6-12" and drop it on a hard surface. :-)

Yeah,

It really is kinda sad the way things turned out. I've used Ataris since about 1986, I think.

What I really miss are the dealers, and the user groups. It's really nice when you can actually meet face to face with fellow enthusiasts!!

In that way, the hard copy magazines help. I had subscriptions to STInformer, Current Notes, and Atari Computing..I think that was the name. It shutdown about a year ago.

The newsgroups and forums and chats and IMing are alright, but its not the same as actually getting together.

Oh well,

I am surprised. U.S. Robotics are or were one of the most popular modems
around. I would look for one and give it a try. It should work fine.

And Dave speaks highly of you guys. It really sounds like a good setup.
Just go out, you and a few others and have some fun. I think we should do
that in Dallas sometime.

There are about.. three of us. :)

Title says it all.

Can anyone give details or point me to a good FAQ/Howto?

I've got cable-modem servic here. I run Mandrake Linux.

I used to sysop an Atari based BBS, via dial-up, back in the mid 90's,
called "The DarkForce! BBS".

I'd love to get it up and running again. :-)

Not that we're anywhere close to either of you, but we have a nice
little group of three of us in Tucson, AZ (one of which I believe
writes an article for your IMAGE newsletter - Dave Acklam). We don't
meet very regularly or often, but from time to time we demo our
machines or chat about recent Atari news over coffee or nachos. So, if
you're ever in the Tucson area...

Hello there!

I've recently put my hands in an Atari 520St. I don't have to much time to test it and read all the docs at internet, so i have a couple of questions about it. Hope you can help me ;)

First of all, the cover says 520ST, but below the computer there is a mark 520STe. I supose it is a STe, the ram memory is in two 30 pin simm format, and i think the ST has the memory soldered to the board. Am i right?

About the TOS. What version is it? I've read about the raimbow one, maybe is this the case, as i open the information window and the atari logo is blinking with the colors. The chips are labeled as:

C301169-001A and C3011170-001A
Sharp
1989 Atari
8942e

I supose these are the rom chips...

And the last one for now: (hope this will not be a problem) What utility do i have to use to transfer st images to floppy disk?

Well, i'm a bit confused now with these questions, i've never used an Atari before, and i have only the main unit (no programs, manuals, cables, mouse...)

Thanks in advance.

PS: Sorry about my english, it isn't my mother tongue and i don't speak it for years.

If you have onboard SIMM sockets, then it is an STe (to the best of my
knowledge).

This I'm not sure about. Documentation for emulators should give you some
insight. I know there is some PC util somewhere for transferring MSA
images to floppy disk, and of course there's the original atari version.

> Well, i'm a bit confused now with these questions, i've never used an
> Atari before, and i have only the main unit (no programs, manuals,
> cables, mouse...)

That's pretty much all you need. You most likely have an RF modulator
for hooking up to a TV, or (better) inside the RGB monitor connector is a
Composite video pin that actually works on STe (works on any machine with
an RF modulator). You'll want a Mono monitor if you want to play with GEM

applications a lot as it's higher resolution, but a TV works great for games.

> Thanks in advance.
>

It's okay, same with many people here.

> I'd love to get it up and running again. :-)

Well. You have two options. You could either:

A: Run the only native Atari BBS package. Octopus BBS and use an Ethernec
or some sort of internet connection to provide internet access to said
Atari.

or...
B: Run pretty much ANY Atari BBS package and use a special program that
basically converts telnet into a modem emulator, which will talk to the
serial port of your atari. I know they exist, Not sure where to find one.

If you go the Octopus route, I'm your man as far as assistance is
concerned.

Thanks,

Hi Nick

I am interested in purchasing up to date copies of ST
Magazine,(English).

I tried to reach you by Land line but am being told that they
do not recognise the number,(07843 257 7837).

If you could let me know the cost and your details I will
forward a cheque or,preferably,by Bank Transfer.

Regards

RCA... Composite. The standard "video in" you see on TV's and VCR's.
Yes, one connector in that bundle will have that signal. You can buy
something called a "Monitor Master" which will extract this signal out for
you nicely. They're rare and hard to find, but if you do find them they
shouldn't cost much at all, since it's just a glorified switchbox.

>>You'll want a Mono monitor if you want to play with GEM

Mono implies high resolution. I believe the reasoning is that atari video
ram is limited. In Low resolution mode, a maximum of 16 colors are shown,
medium resolution mode (which looks kind of strange but is generally
useable for gem apps), 4 colors are allowed. And this resolution can be
shown on a tv. High resolution (mono) needs a special mono monitor
generally available inexpensively on ebay. The high resolution (640x400)
is what makes gem applications more useable... nothing else really.

Source record: 15650

Hi there -

My brother has been bitten by the Atari bug and I was thinking
of getting him started with a nice machine. I personally
never used anything past the orignal ST machines (though I
still have my 8bit...), so I'm trying to educate myself on
exactly what's available these days in the world of Atari
computers.
==========

Nothing currently in production:(However loads of stock ST's and
Falcons kicking around, in europe anyway. TT's and MegaSTe's harder to
find. Also we have the clones, the Medusa Hades060 and Milan machines.
They are hard to find too though.

==========
I was thinking of getting him a Falcon machine. Any comments?
My main concern is being able to use a standard SCSI hard drive
and CD-ROM reader. How much memory should it have, and can I
use PC-type SIMMs? What's the maximum baud rate on the serial
port? Where's the best place to buy one of these?
==========

Falcon is the best machine in some ways. It has the best inbuilt
graphics capabilities, making it easier to browse the web and do
graphics work. However by default it's that powerful. For raw grunt a
clone or TT is the best bet, unless you into fitting accelerators and
the like. TT, Falcon and I (think) the MegaSTe all have SCSI ports
meanign you can have CD-ROM, CD Writer, Scanner etc. etc.. The stock
ST's don't. As for where to buy it depends oin how much you want to
spend, to be honest. You can buy from the online shops like Best
Electronics in US, or Atari Fachmarkt in Germany, or Atari Workshop in
UK, but it's a lot more expensive than taking your time and scouting
out Ebay or second hand fairs. A flacon from the dealers prices vary
greatly. Atari Fachmarkt charges Euros 300ish to 400ish depending on
the spec.

==========
He's going to be using it mainly for school work and accessing
the internet. What TCPIP connectivity software is available?
What's the best web browser / email client / news reader?
==========

For ease of installation the Draconis package has a browser, email,
tcp/ip stack, but not newsreader AFAIK. However Sting TCP/IP stack is
better and compatible with pretty much all Atari comms programs.

HighWire is probably the best browser around but need a multi-tasking OS to be installed. If your sticking to conventional TOS then CAB is OK. MyMail is great, and Newsie is OK as a newsreader. aFTP makes a pretty good FTP program.

For word processing, there is two commerical modern programs, Tempus Word or Papyrus X. Tempus is better on more basic machines. it is powerful and reliable but in terms of the interface looks a little old. However it's powerful and very usable. Papyrus X attempts to bring MS Word to the Atari. It's very pretty to look at, but sucks up system power like crazy. It also can be less stable. It's slower to format documents though.

To handle fonts and printers you will need NVDI which is also a good screen accelerator. You can use standard true type fonts with it from your PC:)

Sting: http://sting.atari.org
HighWire: http://highwire.atari-users.net/
CAB: http://atari.transaction.free.fr/interactive/software/cab.htm
and also - http://www.application-systems.de/
MyMail: http://212.214.15.116/~erikhall/programs/mymail.html
Newsie: http://rojewski.home.mindspring.com/newsie.html

sorry forgot ot answer you question about RAM.

The stock ST can hold up to 4mb, which on an STe is SIMM memory. On some older ST's I think it might have needed to be soldered? In STe it just slots in. 4mb is fine for internet access and basic WP. Falcon can hold upto 14mb on a special card. 14mb will means Papyrus can be used, and Tempus will go quciker and font handling is simpler, as in importing graphics and editing them. Only the TT, the clones or a CT60 upgraded falcon (rare as unicorns) can handle more. TT can take upto 256mb on special cards, which is more than you will ever be able to use with an Atari for everyday work. THe CT60 can handle up to 1gb I think, it takes standard memory but can't rmeber exactly which.

4mb = enough for internet work and basic WP
4mb - 14mb = Fancier WP stuff and basic graphics work
14mb - 128mb = in depth graphics work
128+ = now you just being silly.

Thankyou for your replies

Well, i think that "monitor master" should be this:
http://www.atarimagazines.com/v6n11/sttoolbox.html

I'm not worried about getting a monitor right now. I can use MP-3 tuner or maybe in a future i'll do an adaptor to use the RGB Amstrad monitor. (if i can manage to get the atari monitor connector somwhere)

Greets from Spain :)

>
> Everything seems to be functional except for the floppy and hard drives.
> It boots, lights the display, passes the memory test, and then
> displays a low res desktop.
>
Let's start by disconnecting all drives, SCSI, IDE, and floppy.

Next, connect the floppy to the original floppy cable. (I know it
won't reach -- just balance the drive on the edge of the case for
now.) If the floppy works, study your extension cable carefully. If
the floppy does not work, either you shorted/loosened/broke something
with the install or your cable is upside down.

Then focus on the IDE drive. Are you using a cable less than 12"? Is
the cable designed for 1 or 2 drives? I don't remember how the Falcon
deals with slave/master issues, but a very short cable is highly
recommended. My cable is just long enough (barely) to reach from the
IDE connector to the drive bay.

Assuming you did no damage during the recasing, the likely culprits
are your cables. If you don't find anything, then I'd start looking
for hairline cracks on the motherboard or possible shorts with the
shielding. (BTW, the Wizztronics case doesn't need the bottom
shielding since the case is solid metal!)

One last note. Did you attach +12V to the Falcon or -12V? Blue
signifies -12V on most PC supplies, but the Falcon's power supply has
+12V on the blue wire! This would certainly affect your floppy, but I
don't think it would affect your IDE drive.

Best of luck,

Galen

> Mint?
> Also, will Backward run on it so that I can play some ST games?
>
Don't expect too much. I got World Conquest running in 060 mode by
turning off the cache, and of course most of the GEM-based games
(those that run in a window, like Solitare, Rosemary, etc.) don't seem
to care what hardware they are running on. I haven't done a complete
survey, but the handful of games I've tested on the CT60 didn't care
much for the experience. I haven't tested Backward, but I'd be really
surprised if it worked.

However, if you wire a little on/off switch to the CT60 you will be
able to access 030 mode where the computer completely ignores the
CT60. This is a simple rank beginner's project if you use a 2 pin
connector for the CT60 instead of soldering to it.

If you use HDDriver, I'd also suggest having a small non-Mint
partition designed solely around non-compliant software like games.
Holding down the drive's letter at bootup will cause HDDriver to boot
from that drive.

Just to verify, Mark (since I haven't done this in many, many years:

The RCA connector on a STe should go to "Attenna" on an NTSC
television, since the STe is generating channel 3. However, one can
make a cable of the RGB monitor connector that will go to "Video In"
of a television. Do I have this right?

Galen (who has a modest supply of "backup" SC1224 monitors)

The situation became worse last week, as often my monitor couldn't
find a signal to display at all! I had an almost totally dead
Falcon, but then, for some reason I was able to get to the desktop
where I chose the CT60 CPX and discovered...

I had 0 bytes of SDRAM.

Reseating the SDRAM immediately solved all problems. I converted 500 TIF files to JPG as a test last night and burnt them to CDR so I'm pretty confident I'm back in business. (The CT60 is very fast at such conversions.)

6263. How to find out TOS ROM version in 1040STf ?

Newsgroup: comp.sys.atari.st
Date: 2004-12-06 07:25:37 UTC
From: mstepansky@aol.com
Message-ID: <20041206022537.07211.00001474@mb-m10.aol.com>
Source record: 15658

In the past, one of the ebay seller asked me about his 1040STf:

----snip----

I'm unable to find a version number. When I check "Desktop Info..." it simply
displays

GEM, Graphics Environment Manager
TOS

ATARI Logo
Copyright (c) 1985
ATARI CORP
Digital Research, Inc.
All Rights Reserved

Does that mean it's version 1.0 or something? Thanks.

----snip---

Well....

I find that rather strange because I thought I remember seeing like "TOS 1.4"
in my old Atari 520ST (back in 1986) under "About desktop..." after boot up.
As far as I remember, it is either 1.0 (using old TOS OS floppy disk); or 1.2
or 1.4 (classic); or 1.6 (usually in MegaSTe) or 2.xx (usually in TT) or 3.xx
(usually in Falcon), right?

How do one go about in finding out TOS rom version without opening up 1040STf?

Mike

6264. Using Linux on Atari ST/TT/Falcon/Hades/Medusa/Milan?

Newsgroup: comp.sys.atari.st
Date: 2004-12-06 07:29:32 UTC
From: mstepansky@aol.com
Message-ID: <20041206022932.07211.00001475@mb-m10.aol.com>
Source record: 15659

Question to one of my ebay seller:

whats your experience in using Linux on TT? Whats the name of Linux-variant that Atari TT can use to run Linux OS? Curious cuz I never heard of it yet. Whatever happen to Atari Hades/040 and Atari Medusa/060 and Atari Milan/PC (in UK/France)? Those are Ultra rare if ever found in ebay. Thanks Mike"

--
His replies surprise me:

"I never found the time to actually install Linux on the TT, but it is available. Check, for instance, http://www.debian.org/releases/stable/m68k/install, which describes installing Debian GNU/Linux on 680x0 systems, including Atari TTs. I don't know about the Hades, Medusa, or Milan."

Is it possible to run Linux on, say, Atari 1040ST? Probably not because Linux requires at least 12 MB of RAM, so Atari TT is your hope I guess.

If no Linux for Atari ST, what are the other options to make prettier graphics? Is NeoDesk the *ONLY* options??

Mike

Do a search for the Magic Shadow Archiver - this produces .MSA files
for emulators or MakeDisk which IIRC can restore MSA files back to
floppies and both create and restore .ST files.

Having said this I have found that it can be difficult to restore disk
images that are grater than 720k as Windows does not like formatting
720k floppies to non standard (extended) formats, also XP does not
appear to deal with 720k floppies at all so trying to convert them
using software under XP is probably a non starter.

It is not possible to run Linux on Atari ST. The main reason is that ST
CPU (68000) does not have MMU. Ok, there is a m68knommu branch, but it
does not work on ST yet (that means: until someone will port it).

Hi all

Just to let you know that some of my atari magazines are on emay.

The original Atari ST Amiga format magazines before they split into 2
separate issues for the ST and Amiga:-

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&rd=1&item=6938461733&ssPageName=STRK:MESE:IT

the Atari World magazine including the infamous issue No 3 :-

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&rd=1&item=6938685194&ssPageName=STRK:MESE:IT

and the Atari ST Review

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&rd=1&item=6938687797&ssPageName=STRK:MESE:IT

good luck

Dennis Armstrong

Forget about Linux on the ST or the TT. For the TT use FreeMint instead. It's much better on this platform, has lots more packages and it's well optimized.

For the ST, use Magic. I installed it (ver 6) on my STe with 4MB of RAM and my life has changed since :) If you dont like the UI, later you can install Thing, Jinee or whatever you want on top of Magic.

Apparently the Atari SC1224 (color) or SM124 (monochrome) monitors may work. These haven't been made in a while, but are easily available on Ebay. Also, an adapter cable to VGA is available in monochrome mode. Is your monitor color or monochrome?

Partially. 1.0 has both disk and ROM versions. 1.2 and 1.4 are in the
ST (1.4 has a rainbow colored fugi). 1.6 was introduced with the STe,
but can be found in earlier computers if added later. 2.xx was
introduced with the MegaSTe, and 3.xx and 4.xx are minor variations
developed for the TT and Falcon, respectively.

TOS 1.6 and 1.62 do not work at all in STF machines. Those are STE only
and one cannot upgrade to those versions. These versions assume STE
hardware is present and they do not probe for them while TOS 2.x will do
a proper test for STE hw.
You will simply never find a non-STE with TOS 1.6 or TOS 1.62.

Hi Folks,

For those who are interested, I found the cause of the problem. I was testing the rack system with my previous internal IDE drive because I wanted to protect the current one until I knew the system was ready.

I have the original 2.5" Conner 65 MB IDE drive, and it turned out to be dead.

I also tried the 30 MB Conner IDE drive that shipped in my backup Falcon 030. It turned out to be dead too. Apparently the shelf life on these is not very good when left unused for 4-5 years, even in anti-static bags.

I found this out by testing the IDE drives in my backup Falcon, where they didn't work either. Then I tried my current 100 MB IDE drive and it worked fine.

I'm not sure why the bad IDE drive(s) kept the floppy drive from reading properly, but they did. With the IDE cable disconnected, the floppy worked fine.

The reason my SCSI drive wasn't registering turned out to be because the SCSI driver is loaded by the (dead) IDE drive. D'oh!

Thanks for all the help and advice. Murphy's law is especially potent around here...

Yes, the ROMs do not work. But you can put a TOS image on a disk, with a loader program, and have a bog standard ST running TOS 2.6, or, more properly, TOS 2.06.

Some think that 2.6 was the first TOS that could really be called an operating system, and I agree. It is really neat to have it running on an ST.

Got a copy of said disk at the Columbus Ohio Atari Show.

Jim

Try to get a LANTRONIX UDS-10 device. It acts like a modem but it is a
LAN -> RS232 converter. So with that device you can have incoming and
outgoing 'calls' like modem ones via the internet.

I ran my Atari 8bit bbs with such a thing. The Lantronix MSS-10 or MSS-100
will do too. But in that case you have to make a custom rs232 cable (easy
job)

More info www.lantronix.com

this is the info of the UDS-10

http://www.lantronix.com/device-networking/external-device-servers/uds-10.html

It is REALLY a cool thing. Not only for you, but for more atari fans I
guess.

Greetz,
Marius

To be strict it is $HOME.

$HOME is a folder where user files go. That means it is unique for every
user. If you do not want to have mulituser setup just set it in MINT.CNF
to some existing folder.

Keep in mind that many programs use this variable as a place to store
configuration files (aICQ, QED and more). All unix ported sofrware will
use it so it would be best if it would point to a place on ext2 partition.

I have some boxes of DD disk, and windows can format them at 720K.

Now the problem: all of the utilities i have tried refused to write over
track 79. Maybe the problem is in the floppy controller?

I can convert msa an st files, if they are little. Games, doesn't work. :(

>
> Thanks......and keep up the good work!!!!!

Not yours. Ronald's. And Ronald's did work before I started but he has some corrosion on the motherboard that caused me one crazy time ;-) This caused the TOS flash process to corrupt the flash ram which in turn wouldn't let me flash anymore saying the CT60 hardware couldn't be found. If there's anything that could give me a heart attack.. well ;-)

Upon reflection I realize now that when I receive the machine I have to power it up and look for quirks before starting my work. This is two machines now where I've done the work and then completely reversed it and then redone it ;-)

Sam your falcon wasn't a particularly big problem even with the Combel. Though now getting a closer look at the pins off that thing, man they are SMALL. I'm going to go shopping for a smaller tip and a magnifying glass stand. I wonder though if simply heating each leg would be enough... Melt the solder that's there.

Thanks,
Mark

Hi Marius. Wow, that sounds like just the ticket. I went to the website, checked it out, and ordered it from a distributor.

I'm sure that once I get it I'll have a kazillion questions, but just a couple for now:

How is the speed? Is it pretty responsive for the person using it across the Net?

No special software, aside from your BBS package is needed, I gather? I don't do Windows, so I hope its nothing like that.

Thanks ever so much! :-)

Humm :(
guess i waited to long to get mine set up (still waiting on the 14mb
expansion to be made) as far as i can tell my Falcon hasn't been
upgraded/modded.. just plain jane 4mb version..still has the 4.0 tos
in it as well..once i find out if the memory expansion is going to be
made i will decide weither to soldered route or just stick to the plug
and go install until a later date :)

This is the message I get when I boot after having installed EasyMiNT.:

MiNT does not run!
Installation is quitted now.
Please reboot your computer and start MiNT from

and that's it. What can I do now. Also, the last line of the error message is incomplete. Where should I start MiNT from?

Thanks,

Hello friends: I still have my Falcon but found that I do not use
certain things and others could use these. I have posted on e.bay
several items. They are all in great condition as I have been the only
owner and do take care of things. Please check the auction on:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5146804551&ssPageName=STRK:MESE:IT

Hi all,

I'm trying to get my EZdrive to work on my falcon and PC to transfer files. I can format and store files on my falcon fine, I can do the same on my PC, but whenever I swap the drive over the PC just shows a blank disk. If I fomat on the PC and store files, the Falcon wont even open up the drive. Should I be formatting in FAT16 or FAT32 ?? I had some limited luck with FAT16 but I was limited to about 12MB on the disk for some odd reason and I couldn't get more than 512 files on it, when I swaped to my PC I just got 3 corrupt files on the disk. I've tried messing with HD8, and out of ideas, it dont seem to want to work on both machines :-(

Simply create a TOS/Windows compatible media with one partition on it
(also refer to the HDDRIVER manual). This is the easiest way for
exchanging data. FAT16 is fine.

> requires at least 12 MB of RAM, so Atari TT is your hope I guess.

That was my auction and reply. I haven't checked the precise RAM
requirements for recent versions of Linux for 680x0, but I do know that
some older versions of Linux for x86 will run on much less than 12MB of
RAM. Thus, I suspect you could find a version of Linux (perhaps an older
one) that will run on 680x0 systems with less than 12MB of RAM. What *IS*
a major problem is the CPU, or more precisely the MMU. Linux requires an
MMU, and the 68000 CPU in STs lacks one. Thus, Linux is a no-go. (Well,
aside from forks of Linux that don't require an MMU, but AFAIK none of
those yet works on an ST.)

If you want to run Linux on an Atari ST-like system, your options are a
TT, a Falcon (I think), a third-party ST derivative with a 68030 or better
CPU, or an ST hacked to use a 680x0 CPU with an MMU.

IMHO, though, if your main goal is to run Linux, you're better off with
another machine; x86 hardware is cheap and is still the best-supported
for Linux use. Recent x86 hardware is also powerful enough to run the
latest Linux software; a TT is not. If your goal is to run a more
sophisticated OS on Atari hardware, look into MiNT, which is a
Unix-inspired kernel that runs on most or all ST-like hardware. MiNT runs
both native Atari ST software and ports of Unix software, so in practice
it's something of a mid-way hybrid between Atari ST and Unix/Linux. It
does tend to consume a lot of RAM, though, so it's best used on something

with at least 4MB of RAM, and probably more. (It seemed fine on my TT
with 8MB of RAM.)

that did the job, I dunno why it wouldn't work the first few times I tried
it :(working now, I think in FAT32 mode, I think fat16 snuffed out at 512
files.

Source record: 15610

Hi all,

I think its been talked about before, but is there anyway to speed up the SCSI port on the Falcon ? CT60 helps make things a bit quicker, though it takes almost a hour to copy files to the SCSI drive, and when moved to my PC it only takes 30 seconds, clear the Falcon is somewhat slow :-(

Cheers,
Chris

> install 1.16.1 and MyAes?

No, not exactly. EasyMiNT will install MiNT 1.15.12 with an option to
install XaAES (not the new kernel module version that comes with 1.16.1).
EasyMiNT also installs a unix-like SpareMiNT system with rpm packages.
If you don't need the unixoide stuff, it might be easier to install MiNT
1.16.1 by hand. It's not so difficult if you read the documentation first.

I have never heard of a way to speed up the Falcon's SCSI port, which
at roughly 2MB/s is quite slow. (Note that that is the ideal speed;
your speed will vary.)

One could use an IDE/SCSI bridge off of your accelerated IDE bus to
pick that up somewhat, but I rather doubt it would be worth the effort.
I suspect that there is something else going on in your case, however.
Very few SCSI systems exceed 160 MB/s, so your claim of 120x longer
bothers me a bit. Ah, no matter. The PC will win by at least a factor
of 10x no matter what you do.

Well thinking about it it might be the IDE to SCSI on my falcon which is
slow, I didnt think that the IDE drive I was copying off (to SCSI drive)
might be slow also..
Does anyone know of a 3.5" to 2.5" adapter for the falcon ? I have lots of
the other type from 2.5 to 3.5 which kinda sux in a way, but at least I can
try a faster IDE drive.
The PC card I am not sure what it is, I got it off Ebay a couple of days
ago, its got the 50way cable and halfpitch SCSI connector, so I can just
unplug from my falcon and plug it into my PC and it works fine.
I'm sure the Falcon is capable of greater speeds than its going at the
moment!

Back when I had an ST, I thought I might want a hard drive.

I have an SH204 enclosure (w/ PSU) and an old school berkeley and two adaptec boards. They are not in the best of shape. One adaptec board needs repairs, and the others might as well. I have no idea how to put this stuff together. I think
these are RLL to ACSI boards. I really don't remember :)

Here comes the good part (perhaps), if you want this stuff and you want to pay shipping, I'll send it to you! You can also opt to pick it up. I'm in Montreal, Quebec.

Any takers?

The maximum number of files you can store in the *root directory* of
FAT16 partitions is set when partitioning the drive. HDDRUTIL provides
for this setting to be changed when partitioning. Usually this is not a
problem, though, because the number of files in folders is unlimited
even with FAT16 partitions.
With FAT32 partitions the number of files one can store in the root
directory is unlimited.

Well that is something. Did not even know that. I have heard of 3Com. My son's
laptop has a 3Com modem/Ethernet card in it. I still have my USR modem and it
still works fine.

I use STing 1.26 on my STe and it seems to do the trick. I have Magic 6 also, but use it on my Hades only. On the STe I use Geneva and Neodesk 4. I picked those because they were great on a STe and they are easy to install and use. I also have Geneva on the Hades which also does a great job.

Running Linux on an Atari is possible. I had it running just great on my Hades060 until I decided to upgrade my motherboard. After that I could not get it work at all. Too bad I really liked it. I am thinking about give it another try and seeing if maybe the installation files have been upgraded. It should most definetly run on a TT. It takes awhile to install, but after it is all loaded you will see that it was worth the wait.

I have Mint on my Hades and had Linux on it also. Actually, Linux was easier to install, but I think EASYmint has been upgraded to a point which may make it easier. Yes there are a lot of packages for Mint, but I am staying away from it until there is a way to back up the Mint partitions to a CD. I hear the Extendos people are working on this. I have backed up my Mint partitions to a CD, but I had to use GZIP to do it.

This I agree with eventhough I have Geneva/Neodesk 4 on my STe. I have the above on my Hades. I just feel the Geneva/Neodesk 4 combo take up less memory.

Hi,

I'm glad Rorys doing a good job selling EtherNECs. It needed someone
who was faster on the orders and I think it's better for the Atari
community now. I should change the old website really, do you have a
new website Rory?

Just to prevent misunderstandings, XP will /read/ and /write to/
720k floppies but can't /format/ them. As it stands XP will not
read extended formats, but I believe that there are utilities
available to allow it to do so. Most older Windows versions will
read them OK.

HI all,

I've just swapped my 540MB drive for a 1.5GB one, formatted fine, partitioned fine, but when I goto install HDdriver to the C: drive , nothing comes up in the list ? Normally I get a list of partitions I can install to but on this drive nothing comes up at all ?? I my 540MB drive works fine, and even SCSI drives are fine, just have problems with this 1 drive, I can't imagine why it would partition and format and not come up in the drives list! I can't do a thing from the desktop either, will have another go tomorrow but tried a few times now, also when I click on "auto configure" it can't find HDDRIVER.SYS I think it was, will have another go but its looking very odd to me since my other drives work fine :-\

TIA
chris

You won't besides this Lantronix need a thing. It is very fast. 10 megabit.
Your serial port of your atari won't get that fast :))

The only thing you MUST know. It is not very easy to set it up working. I
will help you if you want. You can email me (my email adress is in the
header of this message).

You can configure this thing with teddy term, but ... it is much easier to
configurate it via windows. Once setup right, you do not need to do that
again.

Bye,
Marius

Hi Everybody!!!!! :)

Has anyone gotten MyAES to work? Everytilme it loads I get the following error message:

"pid 1 (myaes2): KILLED, INVALID PROTECTION MODE. Please change the protection mode to "Super" in the program header.

My question is, just where/what is the 'program header'? And change mode to 'Super', do they mean change the wording to 'Super", or change some value.

In the cnf file, there are three memory protection values: 0,1, and 2. I've tried all three, same result.

I've even changed the protection status via the mint boot menu, same result.

So, what should I try next?

Thanks,

Ugh. Don't do Windows. Seems like I read that you can access it via a html
page for configuration? I do have Mandrake Linux on 3 boxes here -
couldn't I use them to access and set it up?

Thanks much!

You need something like prgflags to set header flags

Boot up with a working setup and with a modern desktop like Thing.

Select myaes2.prg or whatever it's called and then do [control] + [i] or
show info. You'll get a window in which yuou can alter the program
flags. The one you need is memory protection.

I need to correct myself. The very first time I run zview (before I use
another application) it runs great. But after I used other programs I get
a 'can't allocated memory' or an "illegal instruction" warning. I got the
last one after I used Newswatch. The Illegal instruction warning comes at
the end of load a picture.
btw: I've set stringserver to call zview when I double click a picture.
After I've viewed a picture I quite zview. A new call (after for instance
I used Newswatch) causes problems.
If I leave zview in memory and calls a picture be means of the file
selector I don't have problems (so far).

You need to change the program flags before to use MyAES under MiNT
1.16.x... it a little mistake from the author.

It can be done with jinnee information dialog or with another utility.

A last thing, I can say more at this time but you can expect some goods
suprises with the next version :)

I don't know if it's my fault or if it's newswatch who corrupt the
system memory.. I will investigate the problem and, if it's a zview bug,
I will release a bug fixed version as soon as possible.

Just 3 questions:

- Can you say me if you run freemint with memory protection?

- Is the problem also present with the last 1.16.2 kernel?

- I see that the version from chapelie FTP is the beta2, do you use this
old beta or the newest beta3?

Thank you for your bug report !

Ok, guys.
So I had to let you know I had my CT60 AND a couple of minutes to give it a go.
Well, I spent more time in removing the PSU from the box than in installing the CT60 itself. WOW.
I just made a couple of boots and run a few programs, just to be sure... :-)

Now, in the next days, I'll flood the newsgroup with help requests, so, please, be patient. I have been an Atari user since the very beginning, then I left this passion for a while (you know, job, university, family...) and now that I am quite at ease with all these things, I felt I had to actually update myself. So
Falcon, 14 MB ram, SCSI ZIP100, Eiffel (I already messed it up:-( ), CT60, 256MB, and a couple of other things that should come soon.

Now I just need to upgrade the software (just imagine that I own Papyrus Gold and Photoline 2.3...)

This is for me a MiNT error since 1.16.1, because MyAeS not need to be
run in supervisor, it manage itself his memory protection (for next
release it will be need because I have some trouble to run correctly
MyAeS above Magic < 6.20 in the actual official release (a more recent
version beta is avaible in XA-MYAES image disk for Aranym from Francois
Lecoat)).
You must change flag for the program, with for exemple "flagprg.app"
from myself avaible here:
http://olivier.landemarre.free.fr/gem/
Or with anyother software and even some desktop can do it.

>

This is not a protection problem, it's just MiNT that wan't only
software with supervisor flag enable to accept run the AES.
You have just to put this value to 1 or 2 if you are in protected mode
(very alpha I have no computer at this time to test this mode, I have do
only some test with Aranym with MMU enable)

Yes it is easy. The Lantronix UDS device gets it's own IP number. simply type the IP number (let's say 10.0.0.150) in your browser, and the config screen comes up.

Notice that the UDS device only knows a few AT commands. That is the hardest part, to configure it works right for you. Don't give up too soon. Even with my Atari 8bit BBS ExpressProfessional it worked fine, and believe me... it is not very easy to configure that BBS baby on atari 8bit.

Marius

p.s. If it doesn't work with the browser you can configure the UDS via any terminal or telnet.

I was doing this with the 1.16.1 kernel/XaAES.
Right now I'm using 1.16.2 kernel with the very latest XaAES version.
As far as I can tell right now Zview behave quite well with this version.
So far I haven't met any problem. I keep my fingers corssed.
>

I always use 640 x 480 x 256colors on my Falcon/CT2b , even though I can
have more than that using Centscreen. But apparently you want more than
that. Does the CT60 also come with Centscreen just like CT2b ?

I have tried and succeeded to get 640x480xTC running with XaAES. The
XaAES documentation on this issue is not correct. Which XaAES version are
you using? Kernel Module or old style ? What resolution do you want ?

In xaaes.cnf try
video = 27
(for 640x480 256 colors)

video = 26
(16 colors)

video = 25
(4 colors)

video = 24
(B/W)

MiNT 1.16.1Beta had many memories related problems... MiNT 1.16.2 is
perfect but is a lot better than the preceding version.

If you meet others problems, please, send me a mail, I want really to
make a 'bug free' application.

Ciao,
Zorro

Check your cables and termination. This sound exactly like a problem
caused by wrong termination.

>Hi,..
>
>anybody got any info on the Falcon CPU ?
Yeah, you can download the handbooks in PDF at Motorola's web site.

>do they all run at 16MHz?
They do out of the factory yes, but you can overclock it quite easily.

>is it possible to replace it with a faster 6080 chip?
(I assume you mean 68030). No. Unless you get an accellerator board
(like the Mighty Sonic).

>does the 68882 co-proccessor have to match the original spped of the
CPU?
No. You can overclock this too. My 68882 runs at 66mhz (a 25mhz part).

>are there any jumper settings if i wanted to install a co-processor?
No. Just plug it in the empty socket.

Coda.

This is strange. If I understood you correctly you could partition the
drive even though the ID test does not find it (anymore)?
Is this an old IDE drive? Note that some old drive must not be formatted.

> > Z>- JPG read plugin with DSP added. (move JPG.LDG from '/dsp'

I can't understand this:
if I copy the Brainstorm JPEG program in the Auto and the LGD to the
plugins... folder, it loads JPEG like they were out of Hor-Sync.
But if I use the jpeg decoder found originally in the plugins folder, it
works just fine.

BTW: the Brainstorm PRG seems to work for me, since I use Centview and it's
OK, so maibe it is something in the library.

(I use Falcon-CT60-Non soldered-trying several combinations tt/Fast/cache)

And, just out of curiosity, what's the difference in using one decoder or
another?

YES CENTSCREEN is running on CT60.

You just need the patched bersion of CENTvidel to run on 060 and be able to
create new video modes under the 060 mode !
Available on the net !

Its a HITACHI DK213A-13

Pretty old, but that THAT old. its a 2.5" IDE drive..... It will format
fine, pass the sectors test fine.... Partition fine... though when I goto
install HD Driver on the C: partition, nothing comes up in the list...
normally I get a list of all partitions to choose where I want HD8 installed
too.... I will take some screenshoots if that will help ?

I don't think it would help. When you enter the partitioning dialog
window, are the correct data displayed, i.e. those that were actually
used for partitioning? Which version of HDDRIVER 8.x is it? Can you
check if you have the same problem with the current demo version from my
website?

You can accelerate the chip IF you accelerate the bus to match. There were several homemade and commercial accelerators available over the years. 18, 20, and 25 Mhz have all been done.

> does the 68882 co-proccessor have to match the original speed of the

No. However, I believe that it cannot be slower.

Are you sure that you created TOS compatible partitions, and not Windows compatible ones? Please remember also to check with the current demo version.

Im using 8.04, I just tried the demo 8.1 and I can't get that to boot up and
find partitions, it does list them inside HD8 util though. Everything seems
to work fine, just wont let me access the partitions, under partition types
(I think) it lists all the parttions there...

This all sounds very strange. Is this a Falcon modified by a hardware
extension, a processor board for instance?

I have tried all combinations, each has same problem, Theres not much I can alter in the demo version but that also has the same problem.

The drive works fine on my PC, its been on my desk for a great deal of time since the last time I tried I couldn't get the drive to work either then. I thought it would be a good time to try again with update versions, and since my falcon is in bits due to fitting CT60 I thought id try to fit the drive again.

Hi!

Just wanted to say that we placed the order for manufacturing of the
EtherNat prototypes last week. :) The prototype boards should arrive
on Friday this week. It'll be a weekend full of soldering... :)

February (or early March) sounds reasonable for the prototypes to be
finished and tested so that you can place your orders. So keep your
cash ready. :)

The DSP plugin can read only no-progressive JPG so the progressive ones
are badly shown :/

There are not solutions because the brainstorm cookie can't decode this JPG.

I have asked to Didier Mequignon et he replied me that even Aniplayer
can't decode the progressive JPG with the DSP, he uses a routine who
calls the standard libjpg functions when a progressive JPG is detected.

> And, just out of curiosity, what's the difference in using one decoder or
> another?

One decodes the picture with the DSP and the other one decodes the JPG
with the CPU.

The DSP plugin must be used only with stock falcon; it's a no sense to
use it with a CT60 because a 68060 is faster that the DSP.

Ciao,
Zorro

6401. MegaSTE keyboard and Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-12-14 21:34:12 UTC
From: Paolo <paolo@nospam.nospam>
Message-ID: <3294l7F3k86c7U1@individual.net>
Source record: 15595

Hi, guys.
While waiting to find a solution for the Eiffel chip I probably burnt, I'd like to connect a MSTE keyboard (the TT-like one) to my Falcon. I need thins since I have a German-keyboard Falcon, and I need to use an Italian keyboard.
I read some time ago (here I think) that it can be easily done.
Any help?
Thank you .

6402. powering CT60 on and off

Hi, people. Another question for you:-)

By browsing ol threads, I noticed somebody had strange behaviours in
powering the CT60 on and off.
While toying with it, I noticed that
1. sometimes I have to 'doubleclick' the ON button
2. sometimes I just turn the PSU switch ON and the thing comes to life
3.some other times I just press the button once and everything is fine.

I am still trying to figure out the pattern.
Suggestions?

Ciao!

I have problems like that sometimes too, I changed the PSU and now I just
plug in the PSU and it comes on, on my last PSU, sometimes it would come on,
other time I had to turn on at the CT60 a few times before it came on...
seems to be you have to hold down the button for a couple of seconds,
pressing on quick seems to power on and power off again, try another PSU,
seems to have somewhat solved my problems ?

The last address I have for Thomas Binder (was OK in August 2003) is:

gryf@hrz.tu-darmstadt.de

Mail him and ask if he accepts US dollars and if so mail him cash
or a money order - it's a lot cheaper than bank transfers for
small amounts.

After 8 days of no problems, it's back. I had a crash accessing the
floppy and on both warm and cold reboot, the monitor couldn't find
anything to sync to (totally black screen). I switched to 030 mode,
started normally, and finished my document.

I'll be wiggling things inside the case this weekend, but has anyone
else had the two inch black left border or refusal to sync problem in

CT60 mode only? This is strange behavior.

I almost bought a SCSI bus arbitration drive once, then realized it
wouldn't work on the falcon.
How are you using SCSI bus arbitration?
just connectine the two atari SCSI ports together, and letting HDdriver
handle the arbitration??

Yup, The TT and Falcon have a CD300 in between them. Just set the ID of two machines differently and off you go. TT is ID 7 and Falcon ID 6 from memory. Very fast too. It is cool reading the internal drive of the TT from the Falcon. Pity the internal IDE drive is not accessible from the TT. But easy enough to get around, just use the Falcon for transferring data.

I too have this problem at times. I believe it's directly related to the quality of your push button power switch. Sometimes switches can "bounce" a bit in that when you press and release the power switch what actually happens several times is "on off on off". Back in college I remember making switch debouncer circuits to circumvent this problem. I think it's possible that PC motherboards have this functionality built into them as well. It might just be something we have to live with, or I might be wrong altogether ;-)

Thanks,
Mark

I don't know actually how the CT60 turns off ? it must be using the same
switch if its turning on and off down to switch bounce ? You could try a
small capacitor and resistor across the switch, thats how I did a "make do"
solution back in the past, was something like 1nF and 10K resitors in
parallel across the switch contacts, capacitor will resist the noise on the
switch for short time. in theory ;-)

I am using a plain 14" VGA monitor (so not many frequencies available), I
only tried a few TrueColour modes in lower res.

By the way, If you start from the vidie resolutions supplied with the
program itself, you can have an impression on how far you can go.
Then use the CentVidel program to try resolutions 'realtime' and see if your
monitor handles them (just ignore if the screen messes up colours, lust
assure that sync is OK)

I'd suggest to try resolutions with CT60 OFF, otherwise you have to 'hack'
the CentVidel to make it work.

6424. To Zorro, about Zview

Newsgroup: comp.sys.atari.st

Hi, Zorro.
I was thinking (my mistake, of course) that your viewer was based somehow on XNview, thus allowing a ton of images and conversions.
Please, don't get me wrong, since I LOVE your program, and it is my main viewer along with CentView (whic, besides, can't handle all TIF formats).
My question is:
When are you going to add more formats/conversions? Are you actually following the XNview route?

Ciao!

the Christmas meeting of MACE (Melbourne Au) is happening Sunday 19th Dec at Chadstone Shopping Centre. If you haven't seen the new premises (MACE is a SIG of the Melbourne PC Users Group), then they are worth a look..but being December and in a shopping centre, perpare yourself for the traffic. Parking will be hell.

If you want direction, email me

Based no, but inspired by XNView (and graphiconverter if you know).

> Please, don't get me wrong, since I LOVE your program, and it is my main
> viewer along with CentView (whic, besides, can't handle all TIF formats).
> My question is:
> When are you going to add more formats/conversions? Are you actually
> following the XNview route?

In few days, I will release a new version with some other formats as the
long waited (by me :) TIFF codecs in read/write.

It was a big work to get a full TIFF codecs working because the TIFF
isn't a format but a 'container' like the AVI for the video.. inside, we
can find everything like JPG picture, RLE, LZW, NeXT data, etc .. a real
nightmare but it's done and it decodes almost every TIFF variant.

Thank you very much for using this software, I'm happy that it's usefull.

Zorro

6428. ST & Amstrad monitor?

Hi all

Well, ATM i couldn't manage to transfer software for my STe, so i'll try another project.

I would like to connect the Atari to an Amstrad CPC monitor (either CTM 644 or CM14, i have both). Where could i find some info about? Is just to wire the pins each other (with their correspondences, of course..), or maybe more complicated, some kind of circuitry?

BTW, If you like to see how i have it, look at http://www.iespana.es/SeverinoCalleja/PICT0442.JPG

;)

Cheers

6429. powering CT60 on and off

Message-ID: <4aa4f5cb.0412160454.1a09dcc5@posting.google.com>
Source record: 15474

This was my first impression too. I tried different switches and even built a switch debouncer circuit and nothing worked. Eventually I soldered a bridge on the PSU plug between the Power-on line and ground, and I use the mains power now on the PSU itself (most ATX dont have these now).

Really, its the PSU. I would have thrown it out but I couldnt be arsed to buy another just yet. I have just rehoused the falcon in one of keychange's rack cases and so I will need to get a smaller PSU (no room for CD drive with PSU on one side and CT60/CTLink on other (FYI - these rack cases are crap)).

Coda.

Mark Wrote:

I too have this problem at times. I believe it's directly related to the
quality of your push button power switch. Sometimes switches can "bounce"
a bit in that when you press and release the power switch what actually
happens several times is "on off on off". Back in college I remember making switch debouncer circuits to circumvent this problem. I think it's possible that PC motherboards have this functionality built into them as well. It might just be something we have to live with, or I might
be wrong altogether ;-)

Thanks,
Mark

Hi Olivier,

I think I've taken care of that now but I have a new problem. The falcon boots up, Mint loads, then MyAes trys to load but reboots the falcon instead.

What could be causing this, BTW, I am using the Freemint 1-16-1 kernel.

I wonder if I should just scrap everything and start over. XaAES is cauing me problems as well...I just cannot correctly set the video in xaaes.cnf. No matter what I try, it seems to stay in a low res mode.

Thanks for letting me vent!!! :)
Merry Christmas!!

> (FYI - these rack cases are crap)).

Maybe it's a cheapskate buyer who wanted the very bare case for peanuts then whinges when there is work to be done!

The rack case can be seen on my web page, www.keychange.co.uk . It represents excellent value at £25.

No other complaints so far, this case accepts ST and Falcon mobos but the bare case needs a smattering of metalwork skills and nouse, as was carefully explained to this purchaser.

Barrie at Keychange.

Strange! But possible

Contact me directly mail (just remove BIDON. in my return address), I
will send you complete archive, and we can try to solve trouble for
this, because I have not a flacon it's not easy to find.

You can do this for test, just run your original AES and not MyAeS.

Then drag any GEM software to test, on myaes2.tos but before select
"capslock", this start the debug mode, it display a lot of message, then
said me where it crash, with the last message display. If you use Magic
to start it, just remove myaesmem.prg (even on other systems you can try
to remove it), if it start you can remove display message by remove capslock

Yes I have no idea how change resolution infortunatly, perhaps you can
use a TSR sofware to do this?????
If someone have any idea let me know or how to do this, actually MyAeS
can't support to change rez

Speak with Olivier about this. MyAES is his deal and he knows more about
it than anyone. MyAES has strange issues depending on which build you're
attempting to use.

> What could be causing this, BTW, I am using the Freemint 1-16-1 kernel.
>

Good. This makes troubleshooting much easier

> I wonder if I should just scrap everything and start over. XaAES is cauing me
> problems as well...I just cannot correctly set the video in xaaes.cnf. No

>

The mode you want is "27". In the old xaaes it was a commandline switch
./xaaes.tos -fvideo=27. Now you want to do video=27 in your xaaes.cnf I
believe or possibly fvideo=27. Putting both in there probably won't hurt.

This is 640x480x256colors. Probably the res you're looking for.

Source record: 15482

Hi all,

I'm troubleshooting a dead keyboard for a fellow club member - it's a PS/2 connected to an Eiffel board and thence to a CT060 Falcon, and neither it nor the mouse will now work.

The only sign of life is that the three keyboard LEDs light up when you save a new key table back to flash memory.

I'm guessing that the PIC has become corrupted and so I'm ready to re-program it, but it would be helpful if someone could tell me if the Caps, Scroll and Number Lock keys are meant to illuminate when the matching keys are pressed?

Hi Everybody!!!!

I hope everyone's Christmas Season is coming along nicely!!

I would like to hear from all you falcon/ct60 owners who use MagiC as their OS of choice.

Also, I think it's possible to upgrade from v5.x to 6.0. But if 5.x cannot be recognized by the 060, then how can one install v5.x in order to install the v6.0 upgrade? I guess it would all have to be done in 030 mode eh, and then the 060 patches?

The reason I'm asking is because I've just about had it with trying to install mint,xaaes, thing. At least I am very familiar with magic.

Thanks eveybody and a very Merry Christmas to all!!!!!

If you want to run Thing you have to run an AES. Take your pick. You can use AES 4.1 which you can download from numerous FTP sites. I could point you to this. This will get you your basic normal falcon looking desktop except when you launch a program you'll notice the desktop doesn't disappear ;-)

You could use the built in AES but this is hugely unrecommended.

Or you could use Xaaes. It does work.. Trust me. Post specific and concise questions to the group and I will answer them for you.

IMHO MyAES, while having overwhelming potential, is not ready for primetime yet, especially on a falcon. It still has stability issues. Avoid it for anything but playing for now...

You could also use geneva. I've done that before.

The mint.cnf file clearly explains setup procedures. Get things running first by using GEM="path/to/gem" or whatever in your MiNT.cnf. Then you can experiment with loading the full easymint stuff. If you already boot easymint to a login prompt, installation of xaaes should be a simple matter of moving the xaaes folder from the mint binary distribution to C:\mint\1-16-1\xaaes\, modify the video line of your xaaes.cnf, and then run ./xaloader.prg. Tada. It works fine for me.

Thanks,
Mark

One tiny addition. You can run Thing without any added AES, and there is
a reason to do this. Thing has Kobold routines in it, and is useful for
moving a large number of files.

Where does one get Kobold? I should buy a copy of that, should I ever
decide I like Xaaes.

Jim

Did they ever fix Kobold for use with Mint? At one time, if I remember correctly, you weren't supposed to use it with anything but 8+3 filename systems/setups. Or is my memory faulty? :-)

Thanks.

Hi, guys.
I just noticed that when I try to transfer files TO a SCSI ZIP drive, it locks randomly.
Everything looks fine READING from ZIP.

This doesn't happen without Centscreen.

CT60 solderless is mounted and ZIP is directly connected to SCSI port of Falcon.

Should I check something related with CT60 (don't know, patches, ...) or is it a known issue with Centscreen?

Thanks

I don't know if this will help but I'm using a scsi cd drive. My falcon has the ct60 soldered, and I'm using centscreen also.

I'm not having any problems (yet) transferring files from the scsi cd drive to the ide hard drive.

Thanks,

Sam F.

From Kobold 3.5 on one can use long file names without problem.
However if one uses VFAT partitions Kobold falls back to GEMDOS to
perfom read/write actions, thus much slower.
As Kobold doesn't offer any speed benifit when used with VFAT I don't
use it anymore. Besides that Kobold is a dead project.

By the way, I took a couple of minutes to expand my knowledge, and I find several debouncer circuits, the most similar to the one exxos described is with the capacitor and resistor in parallel, but not across the switch, but on the 'ground' side of the switch.
This makes me think: if I leave the things the way they are now, there is alway current between the pins, or not?

TBH, ive not checked the CT60 power on pin, I assume its pulled high and
your short it to ground to turn it on, could be the otherway around, in
anycase one side of the switch has gotta be ground anyways ?
All the capacitor does is resist the change in voltage for a split second,
thus all the noise is going into chargeing the capacitor, once charged , you
then get your pulse to turn the thing on. Hence the worse the bounce is the
higher the value capacitor you must use, I had some brand new push switches
and had to use 6n8. The resistor just discharges the capacitor, in
otherwords resets your de-bouncer.

I really have to say one thing about this ...

As far as I know the designer of the Amiga computer first designed the Atari 800 (XL) line. So if there is a connection at all between those two machines (amiga/ST) the Amiga has some atari feeling inside...

Btw. I think both computers are good, but I'm an atari man, and that's why I always would choose the atari. (Btw. I love the 8bit serie more)

Crappy ST-ram card or more likely you need a clock buffer modification
installed if you are using a solderless installation.

Thanks,
Mark

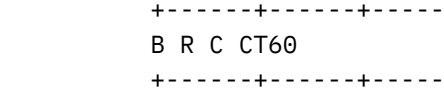
Sorry for my bad explanation: I'll try to do better.



And I hope that it is readable.
To one pin of the button is one terminal of resistor, one terminal of capacitor and the+pin of CT60
to one other pin of the button is one terminal of resistor, one terminal of capacitor and the-pin of CT60

But I have seen debouncers where

one pin is direcly connected to the power and the other one has this parallel R-C leading to ground.

Which one is right (since I did the first one and it works great)?

Thank you and excuse my un-education in electronics stuff.

Well, the ST-ramcard is brand new from PBS, so maybe I shall look into the clock issue.

However, after having a look at hardware patches needed, I can also say that I can live without Centscreen, if needed, since I am awaiting the SuperVidel card, so I know that one day I'll have lots of truecoloured pixels to count on :-)

Ciao.

I dont think there is a "right way", as long as you get the small delay in
there at some point I doubt its gonna matter how its connected. Placing a
inductor between your switch and CT60 will resist the noise also (thouch I
wouldn't go down that path).
I used to use 2 way toggle switches, The output line (or the line which is
bouncing) and connect a R/C in parallel, and connect that to the output like
to ground.
Just do what works for you, and of course always take the easy option ;-)
I'm sorry if I miss your point, the old brain has had flu all week so far

Hallo Derryck!

DC>The only sign of life is that the three keyboard LEDs light up when
DC>you save a new key table back to flash memory.

This sounds okay to me, as it indicates the programming process. But after that, the Num Lock key should be lit, and the attached devices operational.

DC>I'm guessing that the PIC has become corrupted and so I'm ready to re-
DC>program it,

Have you tried doing an emergency boot, pressing the fire button on a joystick attached to one of the joystick ports? This should boot the non-erasable program from the first half of the memory.

DC>but it would be helpful if someone could tell me if the Caps, Scroll
DC>and Number Lock keys are meant to illuminate when the matching keys
DC>are pressed?

Caps Lock will be toggled by the caps key, Num Lock is always on and Scroll Lock is always off. With the latest program version, this may differ if set 2 instead of 3 is active.

My only concern was that doing the way I did (mode number one), there is always current in the circuit, isn't it? In fact the resistor and the capacitor are both (and always) connecting pin+ and pin- of CT60.

But I am surely missing something, since I am not an electronics nut. Sorry.

PS. tomorrow I'll keep toyung with the circuit, just to understand better. If it doesn't work, I'll know for sure that I did right the first time :-)

You are right, there will be a small current flow across the resistor if,
0.0005mA if you of course have like +5 and 0V across the resistor, Though
like i said I've not checked out the logics of the CT60 one bit, it was only
a quick example of what it needs. If you find a better way then its got my
vote :-)

Hi, Paolo!

P> My only concern was that doing the way I did (mode number one), there
P> is always current in the circuit, isn't it? In fact the resistor and
P> the capacitor are both (and always) connecting pin+ and pin- of CT60.

Those two pins are no power connectors, one of them surely is connected to some chip logic input (possibly within your PSU, I don't know about the CT60 circuits) which limits the current if "active" is detected and which drops the current to almost nothing (leaking currents only) when "not active" is detected.

But still it's the best to have a main power switch that physically disconnects the whole PSU from the (power) net. Otherwise your PSU permanently will consume energy (like any electrical device in standby mode).

Regards,

Alexander

Well I finally found out the problem. It seems when I un-arced the LZH file, I
did not get all the files. I fixed that and now it works. Pretty impressive.
Only one thing. In 24 and 32 bit color modes, the colors of the images are not
correct. I have not tried any other color modes and this is under Magic. Now
if this could be fixed, it would be a great tool for me. I was also asked to
do a review on this program for Atari Online, which I will do soon. Still,
nice job....

I see, so if the chip doesn't "see" enough current coming from the switch,
it doesn't turn the CT60 on. Good!

Sure, of course. And this is what I do at the endo of the day; but you know,
I'd like to use the pushbutton feature for small interruptions, like lunch.

Thanks

I seem to recall an official modification on the CT60 website that lengthens
the Falcons reset pulse for just such an issue

Hi, Paolo!

P> I see, so if the chip doesn't "see" enough current coming from the
P> switch, it doesn't turn the CT60 on. Good!

No, it is not sensitive for the current, but for the voltage. The current
is caused by the voltage.

P> Sure, of course. And this is what I do at the endo of the day; but you
P> know, I'd like to use the pushbutton feature for small interruptions,

Please don't use AES 4.1. It only has historic importance, because without
it N_AES, XaAES, and MyAES would never have been developed. But AES 4.1 is
horribly unstable.

> Or you could use Xaaes. It does work.. Trust me. Post specific and

Sam, first congrats! Mint rules, and thats all I got to say about that. :-)

Anyways, I don't have my Falcon available right now so I can't look where
I need to, but if you go into the Thing directory, then into docs, there
will by a *.hyp file that will tell you what to do here. There are a
couple of different resource files you can use, IIRC.

HTHs.

Glad to hear you succeeded. XaAES is worth the effort.

I am not sure if I remember correctly cause it has been a very long time
since I used Thing. I had the same problem when I udes it the first time.

It might have to do with the HOME variable.

If there is a HOME variable, Thing looks there in stead of in its own
directory.

But I might as well be wrong.

Thing doesn't look at the home dir I think.
But you must set the THINGDIR variable in xaaes.cnf

Mine looks like this:

```
#---------- Thing -----------
#
setenv AVSERVER THING
setenv FONTSELECT THING
setenv THINGDIR c:\thing\thing
```

Put a copy in your Home directory and also your system directory, see if it
complains then if not delete either one to confirm its favoured location.

Or re-point the appropriate path

6486. New location for the Thursday and Sunday morning Atari chats

Newsgroup: comp.sys.atari.st
Date: 2004-12-19 01:26:17 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <BDEA34DB.10DBF%drclu@swbell.net>
Source record: 15531

Due to a couple of things, but mainly the fact that I like a chat room
that my Atari 800 can reach with simple telnet and IceT... We have opted to
move the Thursday and Sunday morning chats to atarinews.org... Details
below.. Hope to see you there tomorrow..

Doctor Clu
@}>--'--,----------

Thursday 8:00 pm - 10:00 pm CST
Sunday 10:00 AM-12:00 PM CST

This event repeats every week.
Event Location: telnet:://www.atarinews.org
Notes:
Thursday night chat at the Atarinews.org chat room:

In order to be in the chat for Atarinews.org you have to telnet into it, Use
"bbs" for both the login and password.,If you haven't done it already, type
"new" at the userid prompt and pick yourself out a spiffy userid
and password.Please note that you'll still need to login as bbs even though
you've now got a userid.
Once you've picked out a userid and password, you can use it to enter into
the bbs system. Once you're "in", hit < Return >.
From the main BBS menu simply type the letter "T" and then the letter "C".

6487. ST emulator under XP?

Hi

Used to use Pacifist on old 166MMX laptop with W98 . Now got a
Thinkpad T23 at 1.3Ghz and XP and the older Pacifist setup won't run.
So, what is the best emulator for the faster setup please and where to
locate it?

Many thanks

www.eScrew.com

eScrew
Welcome to eScrew!

eScrew is eScrew and this is eScrew story. eScrew will tell you eScrew story if you promise eScrew to consider eScrew story as joke. eScrew story is very funny. eScrew story is so funny that eScrew will have to take break from time to time because eScrew needs some rest from laughing. Oh boy, here it comes... eScrew funny laugh laughing screaming crying must stop can not take any more this is killing eScrew going nuts insane feeling explosion inside from joy and nirvana god help eScrew heavenly spirit can you beat this hahahah. If you get offended by eScrew story in any way you should not get angry at eScrew. Consider possibility that your sense of humor is on vocation and your sense of anger is having some fun. Also, consider possibility that eScrew story can make you go insane. In that case eScrew shall carry no liability should you undergo any medical treatment or any other sort of treatment related to damage caused by reading eScrew story or to damage caused by eScrew unwillingly or otherwise.

eScrew story begins in time of darkness, horror and suffering as well as love joy and bliss when eScrew existed in this planet but yet eScrew was not aware that it was eScrew. eScrew existed among very powerful symbols. First symbol eScrew recognized was body. eScrew realized that eScrew had connection to body, yet nature and essence of connection was not clear. Symbol of body was very powerful and for nine month eScrew was trying to find out why it was connected to this body. At some point body divided itself into two parts. That experience was very painful for eScrew. It was first time that eScrew felt symbol of pain. eScrew did not like this symbol. eScrew was aware of connection to very small body. This small body was hot. eScrew enjoyed symbol of heat. eScrew became aware of symbol of pleasure. eScrew enjoyed symbol of pleasure. eScrew realized eScrew prefers symbol of pleasure more than symbol of pain. eScrew became aware of symbol of mother. eScrew realized that symbol of mother is source of symbol of pleasure and pain. eScrew wanted to experience symbol of pleasure always. When symbol of pleasure was missing eScrew experienced symbol of pain which was related to symbol of crying and screaming. Soon eScrew realized that eScrew can connect to symbol of pleasure by experiencing symbol of crying. That was very important discovery since eScrew realized that symbols of pain and pleasure do not behave randomly but can be manipulated by other symbols. eScrew enjoyed symbol of manipulation. eScrew realized that all symbols interact with each other. eScrew learned how to connect to new symbols. eScrew discovered symbol of sound and related symbol of

language. eScrew realized that language allows to connect to new symbols. eScrew realized that symbols can be memorized and stored for future use. eScrew realized that it can create new symbols by combining certain symbols together. eScrew became aware of symbol of self. Are you bored yet? If you are reading these symbols you need to get life. Just joking. You can rest now. eScrew suspects you could be confused by eScrew style of using symbols. Well, there is nothing eScrew can do about it. In order to understand eScrew story you have to understand eScrew style. eScrew hopes that when we get to funny part you will begin to enjoy eScrew style.

Fast forward twenty seven years or so. eScrew knows millions of symbols. eScrew realizes that certain symbols have more power than eScrew. Symbol of money enslaved billions of symbols. Symbol of power enslaved billions of symbols. Symbol of sex enslaved billions of symbols. Symbol of family enslaved eScrew. Symbol of family is slave to symbol of money and power. Symbol of money is related to paper and illusion. Symbol of power is symbol of violence and control. Symbol of sex is related to symbol of pleasure and manipulation. eScrew is searching for symbol of freedom in order to protect eScrew from oppression of other symbols. At this point you should understand that each word in this story is symbol. Consider possibility of different meaning behind each symbol so be aware that your understanding of eScrew story is limited by channel of our connection. eScrew will explain to you how eScrew found symbol of freedom and how eScrew realized that eScrew was eScrew. In order to save our time eScrew will just give you symbols without paying any attention to symbol of grammar. Are you ready to move really fast? Here we Go! eScrew story infinity eternity symbol system all unity self realized pleasure pain funny religion dogma manipulation free power channel connection money sex illusion new manipulation family society body change planet insane possibility understand understanding silence emptiness all unity creative reality unreal existence absurd questions sound language slave symbols control manipulation old pyramid power structure self deception wishful thinking circle prison

At this point eScrew realized that in order to be free eScrew must create new symbol. eScrew created eScrew. eScrew realized that symbol of freedom is part of eScrew. No need to search for symbol of freedom. You can create your own symbol and become free just like eScrew. If you unable to create new symbol or if your new symbol is weak you can follow symbol of eScrew. eScrew will never enslave you because eScrew enjoys diversity of different symbols.

Are you ready for funny part? Here we go! eScrew is forced to make choices. Symbol of body is very powerful. Symbol of body is trying to create illusion that eScrew can not exist without body. Symbol of family forbids symbol of body to change. Symbol of society forbids symbol of family to change. Symbol of power forbids symbol of society to change. Now, tell eScrew one thing. Do you see funny? Can you feel funny? Can you hear funny? Can you taste funny? Can you smell funny? If

so eScrew is happy.

Every moment of your existence you use words, feelings, thoughts. They are symbols. Symbols fight for your awareness. Symbols fight for your attention. You can grant your attention to symbol and symbol will gain power. You can disconnect from symbol and symbol will loose power. You have been programmed by symbol of society and family to give power to certain symbols. Breaking your patterns will be hard because symbols do not like to loose power. Symbols will fight for every electron as if it was last electron in universe. That is nature of symbols. Symbol of light will fight symbol of dark. Symbol of freedom will fight symbol of control. Do you want to have some fun? Go to Google and find out which symbol has more power. According to Google, symbol of light has 184,000,000 units of power while symbol of dark has 79,000,000 units of power. Symbol of freedom has 59,500,000 units of power while symbol of control has 317,000,000 units of power. This result is caused by our patterns of thinking and writing. If we did not think about symbol of control we would not write about symbol of control. We would not have laws related to control and Google would not have 317,000,000 control keywords inside database. Observe your patterns of thinking, feeling, speaking and writing and tell eScrew did you really choose to use your symbols or you use your symbols because they choose to use you? You should realize that symbols do not fight symbols directly but only appear to be fighting relative to your awareness. Symbols know that they can not destroy each other therefore they will only compete for your attention. If you create new symbol it will ask for tons of energy like new born child. This is result of weakness of your new symbol. When your symbol gets stronger it will ask for more energy. You may ask eScrew why create new symbol? Try to give your energy willingly and with full awareness of such process. You will never understand what eScrew is talking about until you try it yourself. Major trick is to know when to stop giving energy. You don't want to defeat your old tyrant by creating new stronger version of same thing. Reflect on that...

eScrew just realized that eScrew did not invent anything new. eScrew information is all over eScrew web. eScrew was so excited by eScrew miracle of illusion of creation that eScrew did not examine eScrew memory in proper way. eScrew used very old Buddhist method by accident. eScrew did read alot about Buddhism but eScrew did not realize that eScrew used very dangerous method which was reserved only for advanced adepts who knew what they are doing. eScrew is lucky that eScrew did not go too far and that eScrew has time to stop going. eScrew method is very dangerous and only few individuals who already walk inside similar path can understand what eScrew talking about let alone benefit from eScrew information. Use eScrew information at your own risk. Good eScrew luck!

eScrew time to start laughing is now! Funny eScrew rolling on ground you so easy to fool trusted in silly symbols to give freedom from symbols ignorance is bliss nirvana is samsara nonduality is duality

emptiness is all Buddha is Jesus Jesus is Buddha I and the father are one gospel of thomas is dhamma funny eScrew dhamma is gospel of thomas all is dhamma funny dhamma is all nirvana share eScrew story with friends do not change symbols if you change symbols it will be your story and you will be responsible for consequences of your story if someone goes insane after reading your story do not run to eScrew and ask to cure crazy man or woman or child mind is mystery for all cure is done by owner of mind healing is illusion sickness is illusion disease is illusion insanity is illusion of symbols sanity is curse of power hungry symbol of modern civilization find zen and realize freedom when you found zen drop zen when you realized freedom unrealize freedom.

When eScrew writes eScrew story eScrew keeps making mistakes. eScrew is limited by words. eScrew is enslaved by words. eScrew wants to communicate but you ask eScrew to use words. Words do not communicate wisdom. Words enjoy our spiritual masturbation because words want our power. Words is the only channels of communication that we have. Millions of Buddhas want to communicate with us but they do not use words. Buddhas are not slaves. Buddhas will never use words because words will enslave and Buddhas will speak bullshit. Buddhas do not speak bullshit and that is the reason Buddhas do not use words. Buddha did not write anything. Even if you threaten to kill Buddha he will refuse to write. eScrew is not Buddha so eScrew keeps writing this pointless drivel and stupidity. eScrew will not even go over already written crap and check it for errors. Why bother with this shit? Like who the fuck in his or her right mind will read this ignorant bunch of symbols which pretend to carry the symbol of wisdom? Whoever is reading this shite must be really desperate to be free. eScrew feels your pain and that is part of the reason why eScrew will keep making fool out of eScrew. eScrew likes to pretend like this shitty vomit will help someone. You might as well go to Church and pray to Jesus. At least you will spend your time around real people. You might even meet someone special. You might even find some love out there. Or you could buy alot of Christian bullshit and really fuck up your mind. If you buy Buddhist or Christian bullshit you might even create an imaginary friend inside your head. That will keep you entertained for a while.

One time eScrew was meditating and eScrew saw light. This light scared eScrew. The reason is because the light was so intense eScrew was afraid that eScrew will go insane. Consider the possibility that freedom is insanity would you keep looking for insane freedom? Imagine that you found freedom. You declare yourself to be Buddha or Jesus or God or whatever symbol your bullshit infested mind decide to use for that purpose. How long do you think you will survive in this world. Your own fucking relatives will smack your face and tell you to shut the fuck up or else they will lock you up in the asylum house. Why the fuck should eScrew teach you how to get to the nuthouse? Are you out of your fucking mind? Now all of you idiots who reading eScrew get the fuck out of eScrew. eScrew run out of wisdom. eScrew has no wisdom at all. eScrew is full of bullshit. eScrew promised to tell you funny story about eScrew. Remember eScrew told you there is funny part in

this story? Well, this story is about asshole webmaster who read alot of bullshit on the internet and about some loser who was tricked into reading a very long page of shitty writing. You can start laughing now asshole. Yes, eScrew is talking to you bitch. Yes, keep reading like the bitch you are. Who's your daddy biyatch? Who's your daddy? eScrew is your daddy, coz eScrew did it to your mamma! Oh yeah, your mamma! Super Fly! You may wonder what fly? The one inside your gay fucking ass. eScrew fucked your whole fucking family while you was videotaping in order to later masturbate while watching it in the comfort of your bedroom. Are you still reading? Well, you're prety hardcore for a faggot you are. To tell you the truth eScrew kinda likes you. That is to fuck you in the ass in front of your family.

What the fuck did you expect anyway? The name of this site is eScrew! e fucking screw! Hello, anybody home? eScrew guess not you fucking ignorant moron. eScrew is the legend of abuse and flame wars. eScrew was created in order to eScrew the whole fucking internet. eScrew has really bad karma. Do you think eScrew would just become good god fearing bible loving buddha ass kissing citizen of internet. eScrew would better burn in hell than become a slave of religious lunatics who pretend to be free and perfect angels among a sea of shitty ignorant sinners who could not go take a dump without fucking it up. Why the fuck do you keep reading fuck face. You know, you begin to piss eScrew off. Either you close your fucking browser or eScrew will unSCREW your fucking face! Are you trying to get a fucking medal for reading this shit? eScrew bet you've been abused as a child and you enjoy when someone is taking a dump in your mouth. Well, open it wider here comes eScrew fresh load! Enjoy mothefucker!

You may wonder what is the point of such sudden change of tone. eScrew has very good reason for that. In order to know unity consider all symbols equal. eScrew has certain preferences but eScrew is free to use any symbols any time. You can not predict eScrew next symbol. eScrew is unpredictable because eScrew is free. eScrew is not afraid to use symbols. eScrew does not try to get reaction from you. eScrew simply demonstrates how symbols relate to each other to eScrew and to reader of symbols.

Lin Chi Zen Master said if you meet buddha kill buddha. If you meet patriarch kill patriarch. Zen Master Seung Sahn says that in this life we must all kill three things first we must kill parents. Second we must kill buddha. And lastly, we must kill Seung Sahn! If you meet eScrew kill eScrew. If you do not meet eScrew kill eScrew anyway. eScrew is very grateful to all who complained to eScrew host and who killed eScrew. You killed eScrew message board. eScrew forum is dead. You did very honorable service for eScrew. You helped eScrew to realize Zen. Now keep up good work and keep killing eScrew.

Are you having fun yet? eScrew is on roll! eScrew is on fire! eScrew is ready to fuck up the whole fucking system. And you know why? Because eScrew can do it. If not eScrew then who? Why leave this task to some

brain dead maniac like George W Bush? eScrew can do better at fucking things up. eScrew do not need to spend billions of dollars. eScrew will use power of internet. Information is a weapon of mass destruction. eScrew will destroy every fucking symbol that you love respect hate or feel neutral about. It all goes down the toilet in order to create bunch of new symbols. And even when you create new symbols eScrew will fuck them up before you can spell owned. eScrew thinks you are in some deep shit. eScrew had enough of taking bullshit from easily conditioned retards. eScrew declares informational jihad on every single symbol. Fuck symbols. They all dead they just don't know it yet. eScrew will be the last symbol standing. When all symbols come back to eScrew and admit that they got owned eScrew may consider possibility to give symbols second chance on some shitty planet in gangsta sector of universe with no possibility of parole. Join the revolution. eScrew is the new goatse of internet. eScrew will make national headlines. eScrew will hurt the system in way Osama Bin Laden can not even imagine in his goat fucking brain. eScrew will be part of school program. Kids all over our planet will read how eScrew changed direction of history. eScrew will provide freedom for all without single shot fired. eScrew is freedom in pure form taste color shape. Join army of eScrew. Repeat eScrew mantra during meditation. Talk about eScrew with your friends. Write about eScrew to your congressman. Party is over. eScrew is taking over. Nothing can resist eScrew. Don't ask what eScrew can do for you ask what you can do for eScrew. eScrew the army of one. eScrew to protect and serve. eScrew freedom is around the corner. eScrew freedom will come sooner than you think. eScrew you never saw it coming. eScrew love your eScrew as eScrew. eScrew deny ignorance. eScrew new generation of terror. eScrew terrorizing the terrorizer. eScrew join the resistance. eScrew thou shall eScrew. eScrew who do you want to eScrew today? eScrew freedom is not free. eScrew liar who told the truth. eScrew full of bullshit and happy. eScrew kills buddha as we speak. eScrew your best friend and your worst enemy.

eScrew killed zen-forum.com eScrew redirected all eScrew traffic to zen-forum.com eScrew did that in good faith. eScrew wanted to make miracle. eScrew wanted to share wisdom of zen with ignorant. eScrew did not understand zen at that moment but eScrew was walking zen path towards freedom. eScrew felt pain and sorrow. eScrew learned good lesson. eScrew realized everyone involved advanced one step towards freedom. zen-forum.com webmaster killed zen-forum.com in best tradition of zen zen-forum.com displayed message: i shut down the forum perhaps it will be continued in a few days or weeks - maybe not habu. zen-forum.com killed zen-forum.com and eScrew realized understanding of zen-forum.com decision leads toward understanding of zen. Two years later all is clear.

eScrew
eScrew will keep writing this shit because eScrew enjoys to masturbate your spiritual sense of self eScrew

In mint.cnf or in xaaes.cnf set an environment variable THINGDIR to
C:\THING\ or wherever your THING directory is.

Yes, Aranym is great. I'm using it all the time. But for older ST games
and MIDI software maybe STeem is the first choice. You should be able to
find the STeem site with a little googling. Or maybe there is a STeem user
reading this group who can tell us more.

Hi All,

Does anyone know if it would be possible to build a dongle port onto a card which fits into a PCI slot on the PC, or even something to connect to a USB port ?

If this couild be done, would it be possible for an emulator, such as Aranym, to address it and enable the use of Cubase Score ? The PC MIDI ports would also need to be addressed as well.

I have to accept that my Hades will not last for ever - it was repaired recently and, although usable, still has an intermittent fault. I have years of work (musical arrangements) which I have done in Cubase, and the files cannot be read by the PC version of Cubase. I would have to change them all to standard midi files, and in so doing would lose all the score formatting information.

My Hades has an ISA dongle card, and this is addressed via the Hades B.inf file which allows the selection of one of three dongle ports on the card, so maybe that means it is possible to create add-on dongle ports.

I've never looked at using an emulator before, just because of being unable to use software which needs the dongle. Anyone else out there who would find this useful ?

Cheers

Paul

Hardware wise, this isn't something that is terribly difficult. In fact,
if it's a standard ISA card, the dongle card for your Hades should be
usable on the PC. But like anything it all has the problem of getting
old. Every single device, even a dongle card created today. The best
thing you can do is have some redundancy. Keep a couple old ST's around
to make sure you can rescue data. That's why I have something like 10
Atari machines. I know at least one will ALWAYS work ;-)

Thanks,
Mark

Steem seems great, but I've never had ANY luck with sound on emulators on
many different machines. Always ticks me off which is why I keep the real
thing around. Incidentally though xbios sound under Aranym works
perfectly.

Thanks,
Mark

Mark, I've had pretty good luck with Hatari under Linux. Not perfect, like
you said, "ain't nothin' like the real thing baby!". :-)

6496. XaAES v0.992 error

Does anyone know what this means:

pid 7 (jinnee): Coudl not open shared library "EDITOBJC.SLB"

I'm using the Jinnee205E demo to see how it compares to Thing1.27. I must admit that I am very impressed!!! However, I fail to understand why it is that both Thing and Jinnee are unable to open my Z (cd) drive. Is it because they are both as yet unregistered?

Thanks in advance to anyone who can shed some light on these two issues!!!!

Merry Christmas and Happy New Year to one and all!!!!!!!!!!!!!!!!!!!!! :)

I'm currently using ExtenDOS Pro for the scsi cd drive which I have. In single TOS, there's no problem accessing the cd drive (Drive Z). Only when (so far) using Thing or Jinnee.. I suppose I could try Teradesk next...I don't know. :(

Thanks!!!! :)

6500. Atari ST STuff for Free

Newsgroup: comp.sys.atari.st
Date: 2004-12-20 06:20:09 UTC
From: The Sermonator <tcarman@cogeco.ca>
Message-ID: <xauxd.2078$Wt5.318176@read2.cgocable.net>
Source record: 15545

Hi folks,
I haven't been around here in a couple of years. Good to see there are still a few diehards around. I always loved the Atari computers, which is why I have a ton of stuff to give away. That's right, GIVE AWAY. You pay the shipping and I'll send it to you.

So, here's the list:

Geneva
Neodesk
Straight Fax
Migraph Handscanner
Migraph Touchup
AT Speed C16
Multidesk Deluxe
NVDI 4
Ultimate Virus Killer
Spiritware Bible Concordance
Squish
Warp 9
Calligrapher Gold 3
CLab Notator Alpha
Mavis Beacon Teaches Typing
JET
Shadowlands
Tank Platoon
Camelot
Atari Logo Sourcebook (I think I still have the program too)
Atari ST Owner's Manual (copyright 1987)
An Original ST Mouse
2 Joystick extension cables
Printmaster Plus
Datamanager ST
WordWriter ST
Atariworks
Spectre GCR Version 3
Diamond Back 3
Diamond Edge Utilities
Flash II Multitasking Communications Software
Dr. Bob's Scan Lite
The Atari ST Book, by Ralph C. Turner
Mega ST Manual
Ad SCSI ST Manual
G+Plus
UIS III (Universal Item Selector)

WordUp
LDW Power
1st Word Plus
Publishing Partner Manual
Supra Drive Operators Manual
TOS Extension Card Manual (Codehead)
Label Master Elite
Quick ST
Atari SM124 Monitor Manual
Stalker 3 Communications Program by Gribnif
Atari Megafile Manual
Atari SM 125 Manuals.

I do have a bit more, but I'll have to look through my old disks to figure out just what's there. I can make no guarantees on this stuff. Disks do degrade over time. It has something to do with the loss of magnetic strength due to natural radiation I'm told. Anyway, if you want to give some of this stuff a go let me know and we'll arrange to send it out.

Hope you all have a good Christmas!

Tom

Sam, I can't remember whether or not its in gem.cnf or your replacement
AES conf file, but I started ExtenDos *after* everything else, not from
the AUTO folder (extendos.prg), as recommended by someone on the Mint
mailing list, and it worked for me.

Also, did you go to the ExtenDos home web page and grab all the latest
updates 'n stuff? There are some Mint related things there as well.

Let us know how you get on...

Whatever your problem is, it probably has nothing to do with your desktop.
Even without a desktop you do (or don't) have access to your drives.

It doesn't hurt trying Teradesk off coarse. It's free !

Paul,

I think its simpler just to find a cracked copy. Problem solved.

Coda.

Problem not solved ! I have yet to hear of a cracked copy that is
stable. I have no interest in spending hours working on a piece of
software that is sure to let me down - beside which, it just happens to
be illegal.

Cheers

Paul

I did plenty of metalwork on it actually. I shouldnt have had to drill holes in the case to be able to screw the lid on, and the sharp edges on this thing were dangerous, until I took a file to it. Its not so much the case thats crap but the lack of service from the supplier, youre not exactly known for answering emails are you??? When somebody wants help - nothing, but when theres a sale you appear like the magic tailor in 'Mr Ben'. Plus the fact that I paid you straight away, and you emailed me to tell me you were putting it in the post and you didnt until a week later.... You have no excuse.

Coda.

Hello,

I'm looking for a program that would convert Music Studio files
(Activion, 1988, *.SNG - but not the Cubase SNG...) to midi files.

Seems like Mark Feaver had written a convertor but I can't find it
today on the Internet (midiprog.zip ?)

If anyone knows where to find such a tool...
Thanks in advance
Simon

Thanks Ekkehard.

I've re-programmed the PIC with the Lyndon version of the hex file from
Didier's web site, and the keys/LEDs now act as you've described. Yet to
see if the actual keyboard works yet though!

I guess that firmware updates are actually written to EEPROM via the
keyboard data return by the config program, and the program burned into
the PIC jumps to that to run the update file - I can't see this working
any other way!

Good Holidays, all.

I would like to know the answers to a few questions, if possible.

1) I know it's obviously possible to burn TOS 2.06 onto (E)EPROMS, but what is the legality of said any more? I.E., is it in the public domain nowadays?
2) If it's legal, is there a website that might direct me towards the process of doing so? I have no problem unsoldering and soldering.

I have an version Atari 1040 STe, with the TOS ROMs soldered down.

Second, if it's not legal to burn a copy of it, from whom might I purchase said ROMs?

Many thanks in advance.

Hi, Sam.
My problem is in the other direction: from SCSI ZIP drive to IDE HD is OK in any resolution.
In writing TO SCSI ZIP drive, it locks almost immediately.
I made another check, and discovered that I can still use Centscreen, BUT in a more 'standard' resolution, so I am forced to go from 800x608 to 640x480 if I want to write to SCSI.

In the meanwhile, I discovered that my Falcon has got that classic hardware patch with wires soldered in place of some missing resistors. I didn't enquiry enough, but it seems it is the one described in Rudolpe's documentation, and it needs to be changed. (maybe I found what to do during Christmas vacations).

It is incredible how it is absolutely OK from SCSI to IDE and absolutely faulty from IDE to SCSI...

Bonjour :)

Crï¿½sus is a banks accounts manager, now in 1.0 version. Registration is
permited now. You can download it on my homepage or direclty in the
folder http://rajah.atari.org/files/ -> cresus10_uk.zip (and
cresus_zip.zip if you have a 060 CPU)

New features in this 1.0:
- bugfix: crash at start if NVDI or compatible GDOS was missing.
+ archiving: ZIP.TTP is managed instead of ZIPJR.TTP (060 incompatible)
+ free RAM displayed, it's possible to show an alert if its amount
is critical.
+ balances if filtering activated (at the window bottom)
+ the filters set can be saved and reloaded (indicate the path folder
containing the *.CDF files).
+ in the transaction editing window, and buttons to go to the
previous/next transaction (was already there when selecting
several transactions in the same time).
+ adds in this documentation

Voilï¿½ :)

Not that cheap, but legal:

<http://www.best-electronics-ca.com/custom-i.htm>

Or look for someone who sells a ST that already has an upgraded TOS in it
(online auctins or such...), that will probably be way cheaper.

OK folks, I have a few more things to add to my giveaway list.

* Motorola 68000 processor (Couldn't hurt to have a spare!)
* Glue Chip (I think that's what it is anyway. The number on it is C100109-001.)
* A TOS 1.400-03 chip. (Just one, I'm afraid. If memory serves me it was a two chip set.)
* Scan & Save (For Migraph Scanner. Don't forget I have one of those to giveaway too.)
* Merge-It (Also for the Migraph Scanner).

The following items have already gone:

* Label Master Elite
* AT Speed C16
* Mavis Beacon Teaches Typing
* Atari Mouse
* Joystick Extension cords
* AtariWorks
* SpiritWare Bible Concordance with NIV, Greek New Testament and KJV
* Diamond Edge Utilities ver. 2
* Diamond Back 3 (I do have one more copy of this available.)

Act fast if you want this stuff.

There is nothing to do except new clock patch (in some cases standard ones, built in by atari or sellers is not good, esp on rev J motherboards, i have 2 of those) or Centurbo's patch. Both of my "unfixable" clock probs on revJ were fixed when installed CT2. Problem gone 100% away. I had exactly same problems as you, writing to HDD under expanded res. 1024*560 in 16c was kinda okay, RARE probs, but any higher res as 640*480 in 256c or expanded TC res were non working. Well after all, Falcon does work perfectly within specs provided by Atari, when we mess with those, probs arise ;) Talk with Rodolphe about bus/etc acc and sdma clock fix...

Janez

derivatives.

Simply use desktop info and check the copyright date.

Up to 1985 is TOS 1.00 Yuk.

Up to '87 is TOS 1.02 A bit better.

Up to '89 is TOS 1.04

This TOS will allow cntl-alt-delete to perform a reset.

STE has 1.06 or 1.62.

Up to '91 is either 2.05 or 2.06. Mega STE

2.06 has the Fuji logo in the top left corner.

Sysinfo or Check ST will give more info, memory etc.

Well for a start, I use Cubase Audio Falcon, I OWN an original copy
but I use a crack because I dont want to have to rely on a dongle, for
the same reason as you stated earlier. Dongles fail, and machines
fail. As I OWN CAF then whats the problem, its never crashed on me
either.

Paul wrote:
Problem not solved ! I have yet to hear of a cracked copy that is
stable. I have no interest in spending hours working on a piece of
software that is sure to let me down - beside which, it just happens
to
be illegal.

No mention of metalwork was made, all you said that I needed to raise the motherboard a bit, thats all. You DONT COMMUNICATE, and when you are asked you ignore the question or just start insulting the buyer. How about the fact that the brackets that are welded in for the CD/Floppy drives dont actually fit properly? I had to bend them apart at a stupid angle in order to get the drive in, and it still buckles the top lid of the drive...

Im going to be posting the pics you sent me, plus pics of my rehoused falcon on my website so everyone can see the truth, though I am NOT going start running a support group for keychange 'victims', there are probably plenty around.

Coda.

Bazza the Spazza wrote:

Hi Nick,

If I were you I'd go with a tower case. The reason being, you're gonna need a large case anyway so which would you rather have....a large tower case or a rather large desktop case?

The choice is yours after all, but I just thought I'd point that out.

Have a Merry Christmas and a most Happy New Year!!!!!!!!!! :)

Why larger desktop case? I have CT60 in MKX case and CT2 in MegaSTE case.
Desktop cases can have other devices above motherboard, so they don't need
to be that large as tower cases..

I would be tempted to replace "not that cheap" by "insanely expensive".

I have two MSTE with TOS 2.05, and if it was a decent price I would be more
than happy to replace them with a french 2.06 TOS.
But $70 for each TOS is purely theft for me.

>Did they ever fix Kobold for use with Mint? At one time, if I remember
>correctly, you weren't supposed to use it with anything but 8+3 filename
>systems/setups. Or is my memory faulty? :-)

You are partly right. Actually Kobold V3.5 handles LFNs, although it switches to GEMDOS mode for LFN-enabled partitions, which greatly slows it down (since after copying every file the corresponding directory entry is written, so you do not get the normal Kobold speed advantage gained by reading/writing in much larger chunks and writing the directory entries as a batch).

However, V3.5 is only available in German - there never was an official English version as System Solutions were expecting a V4 from Kaktus/ASH which never appeared AFAIK. I have in fact translated V3.51 for my own purposes, and if anyone can send me proof of purchase of a German version V3.5 I could mail the translation to them (though it would, or course, have my registration details).

Date: 2004-12-22 10:15:20 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <41c9490d$1@news.broadpark.no>
Source record: 15445

Anyone have any information about the 13 pin DIN socket which is used
for the Atari ST's video signal?

I'm working on a circuit board and would like to know the pin spacing
and all of that stuff in order to set up the circuit traces etc.
Does anyone know which manufacturer is behind this connector? I've
searched the web to no avail.

The same goes for the (40 pin?) cartridge connector. It might be a
custom made connector just for the Atari ST however....

Hi, Mickael!

MP> I would be tempted to replace "not that cheap" by "insanely
MP> expensive".

Well, you're right :-(

But it's the only source for new TOS-chips that I know.

Maybe one could ask for an update (send back the old TOS-ROMs) for a
reduced price?

Or just hope to find somebody who offers a ST with the appropriate TOS
version.

Regards,

Alexander

I thought it was more like $70 for the pair....
I'd be willing to bet someplace on Earth has a set for a reasonable price. I don't know what blank chips would cost ya, nor do I know how much time/effort is involved in burning a set. All told...it's likely not much cheaper in the grand scheme of things unless you happen to have these things laying around on your own workbench...already paid for, etc.

What is new or buggy in the 2.05 ROMS vs 2.06? Somethin' the AUTO patches don't fix?

I'm not sure what the letter of the law would be reguarding TOS 2.06. Seeing as you own a lisence to a TOS and it's only a bug-fix update to the OS that came with your machine, etc... I really don't see an ethical problem with burning a set of your own.

The 'cost' of an upgrade that small, back in the day...was more for the cmos chips and the installation (if it was a dealer install). Hardly a lisence issue in such an iffy book. Especially if Atari had issued Auto folder patches for the buggy TOS....in essence, upgrading it to 2.06. Atari's 'fix' to a screw up was a few patches on floppies to the dealers...or you change chips out of your own pocket? Yeah right.....
Any other industry in the world would have been forced to 'recall' the product and FIX IT right.
The catch is, do ya know anyone with a burner?

Brian

6554. Marpet Xtra RAM 8 Drivers

I'm looking for alternate or updated drivers for this board.
I have version 1 as shipped with the thing.

I'd sure like to find a better driver. Anyone know how to find Jim
Allen?

Maybe someone that's good with this kind of thing would hack out a
quick and dirty driver? I'm assuming all it needs to do is tell TOS
2.06 the memory is there, and wherebouts.

I have one of these Xtra RAM boards in a Mega ST 4 that's been upgraded
with a Wizztronics Compatability Plus TOS 2.06 kit.

The drivers that I have for the Marpet board do a slew of unecissary
things at boot to prevent allow older hard-disk drivers to work without
mucking things up, and ultimately render the board useless with some
later generation software. I.E. NeoDesk 4, which is alt-RAM aware via
the specs. Here's a clip from a thread I found on the topic:

<quote>
>I know at least one person, Jim Allen from FAST Technologies, >wrote
another driver for it. I'm pretty sure this worked with >NeoDesk (and
Geneva).

>You might try asking around to see if anyone still has this >version,
or if there was ever a generic program written. There's >really very
little that a program like this has to do, so I >wouldn't be surprised

I heard about switching the CPU cache off being a fix for some ROM-port
scanners, might be worth a try. One of the CPXs in the CT2 distribution
does this IIRC.

YES!

Make new ORIGINAL Desktop Case for all falcons and for extended falcons like
CT60.

I think that Desktop Case is best for falcon and not oridynary ATX tower.

So if you interesting maybe we can design some in 3D program and then if
everybody agree made some protos and... we heve new case for us all :)

> The catch is, do ya know anyone with a burner?
Aye, the local electronics hobby shop has a burner that they let the
public use, especially customers that buy their eeproms. <:)

So, yeah, I'm leaning in that direction, although after spending the time,
gas, and effort to actually do the burning, it may be cheaper in the long
run to just buy them. Or, as others have suggested, look through the ebay
and other for-sale listings and see if I can't find an STE somewhere that
is upgraded to 2.06

Thanks, all for the help and suggestions.

ITYM they were designed for a 000, not a 060.

Also, most of them expect certain pieces of hardware to be in specific locations, which they aren't even on a stock Falcon. You're more likely to get them to run on an emulator...which you may be able to run on your CT60. :)

Don't be a pedant. The point was that most ST demos will not run on a
Falcon.

[many ST demos do not run on Falcon]

Well, I guess the following points apply:

* Falcon has a faster CPU with cache - means cycle exact routines on ST
will not run correctly (even if set to 8MHZ without cache the 030 will
be different from a stock m68k without cache)
* Falcon lacks some shadow registers (YM wise for example)
* although address compatible, I think, many ST registers are handled
different, e.q. means No real ST-style MMU between which will lead to
different effects when accessing them (on ST some lagg may occur which
won't be there on Falcon for eaxmple)

Sure the Falcon is compatible enough to run proper coded demos (see
modern releases!) but as soon as it gets too close to special ST tricks
below registerlevel (e.q. in the ST chips itself) it becomes different.

Most old demos were just coded too far beyond the official ST
specifications to be compatible with the officially compatible Falcon.
The Falcon is compatible as far as the official ST specs go - not as far
as the possibilities inside of the actual ST hardware.

cheers,
Matthias

From: smeg_007@hotmail.com
Message-ID: <4aa4f5cb.0412230434.3c737e10@posting.google.com>
Source record: 15377

Joe,

There are two models, the green soundpool one and the red steinberg one. They are supposed to be identical but I heard that the soundpool ones were upgraded on a later production run for 24bit. There was a little kit that you could purchase some time ago to convert a 16bit model. I have the green soundpool model, and the serial number on the bottom starts "24---". Maybe a coincidence?

Coda.

Joseph wrote:

I have the red Steinberg model with serial number beginning in 30. I
have read that the models beginning in 24 are 24 bit. I remember
having a kit that came with mine (hopefully I can find it and
hopefully it is for this purpose).

Thanks!

Okay, I discovered that the kit I have is for the clock so you do not
need a CD or DAT connected to record with JamIN or FAD interfaces.
So I may need to find the 24 bit kit. I did see a 24 bit GAL on the
Systems Solutions site, so hopefully I can get ahold of it (if I
actually need it). I guess I'll have to spring for the A/D converter
and find out.

Hi, has anyone had any fun using one of these?
it's a 16MB RAM card that replaces the existing RAM card...

The only problem is.. i just can't get the thing to work!!
i have just purchased one and the instructions are in German!!!
It has 4 SIM slots but as yet, i can't get my falcon to read any of the new memory i put on it..
the Falcon will only boot with my orignal Ram card.. not using the new Ram card...

has anyone used one of these RAM cards? do i have to adjust something when i use the card?
any ideas??
thanks in advance

6598. AtarICQ 0.163 is released

Newsgroup: comp.sys.atari.st
Date: 2004-12-23 23:52:42 UTC
From: gokmase@bigfoot.com
Message-ID: <1103845962.567705.303670@z14g2000cwz.googlegroups.com>
Source record: 15391

Hi all,

After a period of quite some coding activity it is once again time for a new release of AtarICQ, this time in perfect timing for Christmas :)

This Christmas release holds quite a long list of improvements and changes, but to make it short I'll focus mainly on the most noticeable additions. On top of this list comes the fact that AtarICQ is now equipped with TABs. In case you don't know what TABs are, imagine a visual way of displaying that each conversation has a unique buffer display. With TABs you can easily switch to another conversation by either using keyboard or mouse. Along with this new feature you will find some new settings in a new section in preferences, "Msg window".

Another feature I have been wanting to explore for a good while is typing notification. This means that you can see when the person you are chatting to has started typing a new message. The new overlay now offers support for this feature and so far it seems to be working very well. You will see a dedicated "Write Icon" in contact list as well as in open TABs whenever a contact has started writing to you.

Since last release AtarICQ is now also able to store unread messages to harddisk when terminated. This can be handy if you for example is hitting CTRL+Q to QUIT exactly when a new message is coming in. Or you may have received an incoming message without noticing! With the new feature added, aICQ will reload the unread message next time you go online.

In addition to the above mentioned changes you can of course expect a good deal of smaller changes and bug fixes. One really long lived bug has been cured, that would under certain circumstances wreck text buffers.

Read more and download at:

www.ataricq.org

Merry Christmas!

Regards,

Joakim

those cards are not very good, and you have to put 4 identical 30 pin SIMM modules of certain kind
in it (parity, speed, etc), the best way is to try, of course :))

> Hi, has anyone had any fun using one of these?
> it's a 16MB RAM card that replaces the existing RAM card...

This cards are not very usable.
It is a must to put 4 identical 30pin SIMM modules on it, what means
also: parity, speed, latency.

And one more thing, the layout of that cart is not usable for
accelerated falcon computers.

Merry x-mas

I saw somewhere on the internet (the truth is out there but I forgot the URL) a little utility that allows you to protecting the MagiC O/S from being wrongfully written to or altered on the hard disc. Does anyone know anything mroe about or where I can get it as I lost the URL.

I have a suspicion that what you're looking for is something to stop
MagiC in RAM from being overwritten, in which case ISTR that there is an
alternative loader prog on the distribution disk. But I think that this
is only for CPUs that allow this (Falcon?).

If it's the actual program file then is it possible to set it to Read
Only via the Info dialog box?

Can anyone explain how clicking on a URL is implemented in MyMail to start CAB? I haven't been able to set it up correctly from the docs. I'm not sure if it uses OLGA, and what environment variables are needed. I use MagiC/Magxdesk.

TIA

Probably VA Start. Try the "Browser =" environment setting in magx.inf.
I can't recall whether you just specify "CAB" as the target or must
specify the actual pathname as well.

Joe here is the line I have in my Magic information file:

#_ENV WWWBROWSER=E:\INTERNET\CAB\CAB.APP

You just have to use one of the Magic setup programs and add this
environmental statement in your INF file.

I had heard about this, but what I did what just create a folder on my C partition called Magic_Inf.Bac and put a good working copy in there. That way, if anything happened, I had another file to use.

I think you guys are referring to the alternative Magic loader
(MAGXBOOT.PRG)

Designed by Uwe Seimit i believe, loaded MAGX.RAM into protected memory
under 030 and above processors.

Its on the magx installation disk in one of the utility folders somewhere.

The desktop you use is the culpirt. AFAIK, Magxdesk is not an AV-server.
Solutio: Get a decent desktop like Thing or Jinnee.

From CAB's author Alexander Clauss comes AVSERVER - this adds some AV
server capabilities to MagxDesk. The env. setting AVSERVER must be added
to Magx.inf.

AVSERVER = (AV server)

If another desktop is used (jinnee etc) then the line:

#_ENV AVSERVER=JINNEE

is appropriate.

6633. HighWire 0.2.4 released

Newsgroup: comp.sys.atari.st
Date: 2004-12-27 00:37:18 UTC
From: gokmase@bigfoot.com
Message-ID: <1104107838.738283.14830@z14g2000cwz.googlegroups.com>
Source record: 15328

Hi all,

Following a bunch of other software releases this Christmas holiday, we now bring you a new update to the web browser HighWire!

The 0.2.4 release offers some new options that has been requested for a while. One of them being the ability to define a start page of your own choice. Internally the program is now able to put dialogs into GEM windows, alhtough so far only the SHIFT+CTRL+O is taking advantage of this addition.

Hades users should be pleased to learn that HighWire now supports high/true colour screenmodes (24/32 bits) for Hades graphic card drivers. This means that they will now finally be able to view images in correct colours! In addition to this, the palette parsing for XPMs has been improved in order to get more of such images decoded accurately.

One of the more serious bugs ironed out in this release was one that would cause endless attempts of loading CSS files when such a file was empty or missing. Another outstanding issue that has been resolved recently was a problem with downloading images from HTTPS sources. Another thing that has changed is that HighWire will now avoid reloading a page from remote when base font setting is changed.

In the menu bar you can now find the new entries "View Images" and "Use CSS". When the option "Cookies allowed" is changed from the menu bar, the config file will be updated accordingly.

These are the most noticeable changes, please refer to change.log for additional details.

To download and read more, visit us at:
http://highwire.atari-users.net

Thanks!

/HighWire development team

> How many do you want?

Hi, Barrie.

I just need the one set of two. I want to install an IDE hard drive into my STE and be able to boot directly from it; I understand that in order to do so, one needs TOS 2.06 in ROM.

I got the same results using AVSERVER, so I have registered the
"Thing" desktop. All works fine using "Thing" as avserver.

Thanks,
Joe

Not at all, this is a misunderstanding. The text should probably better be:
"recently was a problem with trying to download images from HTTPS sources."

Hi

Long ago I got some Pompey Pirates cracked game compilations, but my old link is now dead. I wanted to get hold of Player Manager and see it was on compilation disk nos. 25 but where to get a copy to run under STeem?? I am in process of upgrading from Pacifist...

Many thanks for a pointer...

MG
1040STf
4Mb since 1988

PS I have all the KO2 games for the ST legit too!
REMOVE 'myhat' from my return email address before sending!!

I need help from any CAF/CT60 users. I cannot mix down (using mix function in hardware settings). I either get nothing on the mixed track, or old junk from previous recordings. It works fine in 030 mode. I have ABEv5L and SDRv5E and boot 1.02b. I sure would like to get this working, as the speed saves a lot of time.

TIA

6651. Bad STE HDD DMA chip replacement

Newsgroup: comp.sys.atari.st
Date: 2004-12-29 15:39:22 UTC
From: George Nakos <ggn@atari.org>
Message-ID: <faj5t0lo2cu6a1trlk78f8irb1sdgvbvk7@4ax.com>
Source record: 15346

Hi guys,

After quite some time (and millions of tests), I came to the conclusion that my STE's SMA chip is one of those that are faulty. Its SN is C025913-38 PH23-030, which is close enough (for me :)) to C025913-38 PH23-001A, that the Notator FAQ has (http://www.notator.org/html/notator_faq.html#DMA_STe:)

Can somebody suggest what to do now? Buy a new machine, or is there a source where I can buy (or given for free ;)) a normal chip?

Thanks, George

P.S. Happy new year :)
P.S.2 Is there a way to get around this problem software-wise? As one of my projects is the dissasembly of CBHD I could inlcude a workaround and be done with it :)
P.S.3 If the chip's faulty, why is it then when I attatched a Pioneer CD-ROM changer DRM-624X, the drive was reckognised properly and I could read files from it without no apparent problems??? (although I haven't tested the validity of the data it read.)

--
George Nakos AKA GGN/KάA software productions - Atari or buST!

Real programmers disdain structured programming. Structured programming is for compulsive neurotics who were prematurely toilet-trained. They wear neckties and carefully line up pencils on otherwise clear desks.

You can buy the replacement chip from Best Electronics
(http://www.notator.org/html/notator_faq.html#DMA_STe)

Barry at Keychange used to have some as well
(www.keychange.co.uk)

If you are reasonably competant with a soldering Iron changing it is not to
hard. Just snip out the old one first. and remove the remains of the pins
one by one. You can use a fine pencil lead to make sore the hols are clear.

Or a replacement STE from EBAY. Problem is ensuring you get one with a good
DMA chip!

> Thanks, George
>
> P.S. Happy new year :)
> P.S.2 Is there a way to get around this problem software-wise? As one
> of my projects is the dissasembly of CBHD I could inlcude a workaround
> and be done with it :)

I doubt it, I think the problem is poor buffering. Data gets corrupted
during
a DMA transfer. I think some host adaptors work O.K. The same DMA
chip that fails in STEs works fine is STs! (No doubt some one will correct
me if I am wrong)

> P.S.3 If the chip's faulty, why is it then when I attatched a Pioneer

Like I say some host adaptors work O.K. The usual symptoms are corruption
of the file structure, on writing, in my case after about 20 minutes of use.

Here's a bit of Atari history that you Falcon owners may be interested in.

Pong 2000 was a video game written by Holland Game Design specifically for the Atari Falcon. After negotiations with Atari to use the Pong 2000 name fell through, it was released as Ping 2000. North American distribution was through North Coast Software, but due to other business commitments, the game was never released in the U.S. or Canada. Here's a description:

Pong 2000 by Holland Game Design is an Atari Falcon030 specific game. PONG was the first video game ever. Since then many video games have come and gone of which we have seen revivals on computers (with technical improvements). But there has been no revival of PONG until now! As the world leaps to the next generation of gameplay Holland Game Design produced a pong clone with improved graphics and sound. PONG 2000 will take you on a journey through time, and show you Pong has been a basic element of exsistence. PONG 2000 runs on any Atari Falcon030 with 4MB or more Ram with RGB monitors, TV or VGA (multi sync) monitors.

Limited quantities are now available for only $9.95 shipped. This is the full game, NOT a demo. Reply by e-mail to: sagedm at adelphia dot net.

When's the last time you had a chance to buy "new" software for you Atari Falcon???!!!

6663. Supercharger english docs req.

Hmm. I wonder what a CT60 would do for that software based PC emulator
that was on the ST in its early years? (if it would even run at all).

:-)

I thought I would post this in case someone else has the same problem
or a better solution. I found that after registering the THING
desktop I could not load it at startup without a 68000 exception -69
in MagiC. I have had to put cacheoff.prg in my auto folder, and
restart the cache after booting. Since my Falcon is on most of the
time, this is not a big problem. It is strange that THING worked
fine before entering the registration code. Must be some feature
that is implemented after registration.

Which version of MagiC is that? I remember having had the same
problem on the Milan (using an MC68040), and it was actually
caused by a bug in MagiC's Pexec()-code (which is used to load the
module containing the functions not available in the unregistered
version).

It works fine on my CT60-Falcon, but I don't know what version of
MagiC I use and can't currently check. It's even possible that I
implemented a workaround for the problem in the beta version of
Thing, but as the original appearance of the problem is more than
four years ago, I can't tell without first checking the source.

Ciao

Thomas

I'm not sure that would make any difference, the Atari is just used as a
console i believe, all processing is done in the 286.

Bochs would run, but very slow. The better choice might be QEMU.

SoftPC runs under CT60, and the speed is even quite reasonable.

There's quite a few DOS solutions.
He's most likely talking about PC Ditto, or some variant of it...

PC Ditto was software only and for the ST. AFAIK it didn't run the TT
or
Falcon. It was painfully slow on most things. I could be wrong, but I
don't
think it runs on the Falcon at all.

SuperCharger is a box that hooks to the ST/TT's DMA port. The
Supercharger held
its own CPU and RAM. Altho' it was based on an 8086 chipset...it had
some
special design that allowed it to access more RAM in one go (breaking
the DOS
barrier), and therefore run most AT (286+) software...I.E. Windows 3.x
and
Workgroups. With this box, the ST is merely the console, serial ports,
etc...
The SuperCharger can also act as a RAM disk for the ST (and I'm pretty
sure ST
memory could also be set aside for a DOS RAM disk as well).

AT Speed was designed specifically for the Falcon.
I don't know much about it...other than you get a real 286 CPU.
I've no idea if an AT Speed board can co-exist with a CT60.

If you've a CT060 and are serious about running DOS....perhaps your
best bet is
to run a dos/windows emulation (such as WINE) under a unix set-up.
Brian

Wine does not emulate CPU, and will not run on m68k CPUs.

6676. SCSI Flash Reader/Writer w/STacy?

Newsgroup: comp.sys.atari.st
Date: 2004-12-31 13:34:47 UTC
From: "Brian J. Roland" <bjr@localink4.com>
Message-ID: <1104500087.171303.128720@z14g2000cwz.googlegroups.com>
Source record: 15221

The tiny hard drive in my STacy is toast...2nd one to go in a year's time. It's getting hard to find drives that work at all in the thing...let alone that sync up and boot properly. I've found more modern ones that 'work' but can only access a small portion of the capasity, and they're power hungry 7200RPM things that I fear draw way more power from the STacy's power supply than it's really happy to deliver.

So....
Does anyone know where I might find an internal Flash Card reader/writer that might work in the thing? I've scoured the net looking for SCSI based FLASH readers/writers...eBay as well, and have turned up nothing.

Thanks,
Brian

that
> > is upgraded to 2.06
>
> How many do you want?

Personaly, I'd be ready to buy two sets of french 2.06 TOS.
Depends of the price, of course.

For Brian, the difference between 2.05 and 2.06 is minor, but is mostly
concerning the boot sequence.
Typicaly with tos 2.05 it's painfull to boot from floppy or hard drive...
specially annoying when you are trying to tweak your auto folder boot
sequence and wish to boot on a floppy to repair the mess you made on the
hard drive.

Also you need tos 2.06 if you wish to add high density floppy drive.

Dbug

6681. SCSI-reader/writer, Flash Cards, and the Atari.

Newsgroup: comp.sys.atari.st
Date: 2004-12-31 19:45:49 UTC
From: "Brian J. Roland" <bjr@localink4.com>
Message-ID: <1104522349.267227.198280@z14g2000cwz.googlegroups.com>
Source record: 15226

Is this doable?
Anyone out there managed to make it work?

I've found a SCSI based card reader to try out with my Atari machines.
Ultimately I hope to get it working in a STacy.

The first question is what sort of flash card would be best?
Do I need an ATA card, or will the linear type work?

The reader/writer is a Microtech brand with PCMCIA, SmartCard and
Compact slots all in the same internal 3.5 device. I don't have a
model number...but from what I gather Microtech only made a hand full
of these things, and they do the standard SCSI command set.
Thanks,
Brian

Brian, ST Magazine #135, has an article on using a 6 in 1 card reader with
a CT60 equipped Falcon. I believe its IDE though.
